

# DX100 OPERATOR'S MANUAL

FOR SPOT AND ARC WELDING USING MOTOR GUN

Upon receipt of the product and prior to initial operation, read these instructions thoroughly, and retain for future reference.

MOTOMAN INSTRUCTIONS

MOTOMAN-

The DX100 operator's manuals above correspond to specific usage. Be sure to use the appropriate manual.

Part Number:163543-1CDRevision:2

- This manual explains the various components of the DX100 system and general operations. Read this manual carefully and be sure to understand its contents before handling the DX100.
- General items related to safety are listed in Section 1: Safety of the DX100 Instructions. To ensure correct and safe operation, carefully read the DX100 Instruction before reading this manual.

- Some drawings in this manual are shown with the protective covers or shields removed for clarity. Be sure all covers and shields are replaced before operating this product.
- The drawings and photos in this manual are representative examples and differences may exist between them and the delivered product.
- YASKAWA may modify this model without notice when necessary due to product improvements, modifications, or changes in specifications. If such modification is made, the manual number will also be revised.
- If your copy of the manual is damaged or lost, contact a YASKAWA representative to order a new copy. The representatives are listed on the back cover. Be sure to tell the representative the manual number listed on the front cover.
- YASKAWA is not responsible for incidents arising from unauthorized modification of its products. Unauthorized modification voids your product's warranty.

## **Notes for Safe Operation**

Read this manual carefully before installation, operation, maintenance, or inspection of the DX100.

In this manual, the Notes for Safe Operation are classified as "WARNING", "CAUTION", "MANDATORY", or "PROHIBITED".

Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury to personnel.

Indicates a potentially hazardous situation which, if not avoided, could result in minor or moderate injury to personnel and damage to equipment. It may also be used to alert against unsafe practices.

Always be sure to follow explicitly the items listed under this heading.

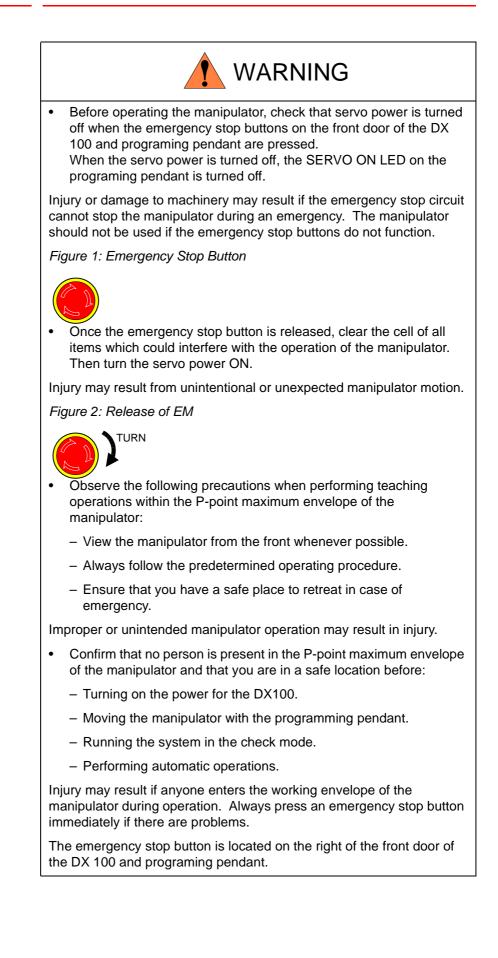

Must never be performed.

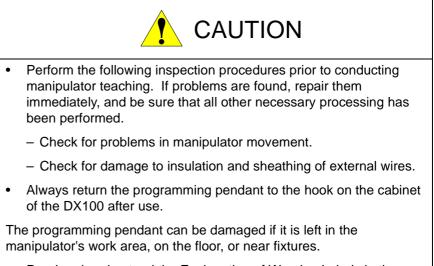

Even items described as "CAUTION" may result in a serious accident in some situations.

At any rate, be sure to follow these important items.

To ensure safe and efficient operation at all times, be sure to follow all instructions, even if not designated as "CAUTION" and "WARNING".

• Read and understand the Explanation of Warning Labels in the DX100 Instructions before operating the manipulator.

## **Definition of Terms Used Often in This Manual**

The MOTOMAN is the YASKAWA industrial robot product.

The MOTOMAN usually consists of the manipulator, the controller, the programming pendant, and supply cables.

In this manual, the equipment is designated as follows.

Equipment	Manual Designation
DX100 controller	DX100
DX100 programming pendant	Programming pendant
Cable between the manipulator and the controller	Manipulator cable

Equipment		Manual Designation
Programming Pendant	Character Keys	The keys which have characters printed on them are denoted with []. ex. [ENTER]
	Symbol Keys	The keys which have a symbol printed on them are not denoted with [] but depicted with a small picture.
		ex. page key The cursor key is an exception, and a picture is not shown.
	Axis Keys Numeric Keys	"Axis Keys" and "Numeric Keys" are generic names for the keys for axis operation and number input.
	Keys pressed simultaneously	When two keys are to be pressed simultaneously, the keys are shown with a "+" sign between them, ex. [SHIFT]+[COORD]
	Displays	The menu displayed in the programming pendant is denoted with { }. ex. {JOB}

Descriptions of the programming pendant keys, buttons, and displays are shown as follows:

## **Description of the Operation Procedure**

In the explanation of the operation procedure, the expression "Select •••" means that the cursor is moved to the object item and the SELECT key is pressed, or that the item is directly selected by touching the screen.

## **Registered Trademark**

In this manual, names of companies, corporations, or products are trademarks, registered trademarks, or brand names for each company or corporation. The indications of (R) and TM are omitted.

Spot and Arc Welding Using Motor Gun

- 1 Introduction
- 1.1 DX100 Overview

### 1 Introduction

### 1.1 DX100 Overview

The main power switch and the door lock are located on the front of the DX100 controller. The emergency stop button is installed in the upper right corner of the cabinet door and the programming pendant hangs from a hook below the button.

For information on setup, installation, and connection of the DX100 system, refer to the "*DX100 INSTRUCTIONS*".

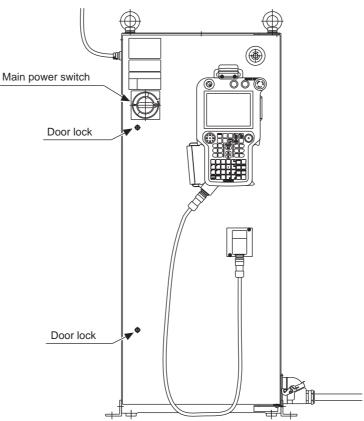

Fig. 1-1: DX100 Front View

### 1.2.1 Programming Pendant Overview

The programming pendant is equipped with the keys and buttons used to conduct manipulator teaching operations and to edit jobs.

Fig. 1-2: PP Overview

- 1 Introduction
- 1.2 Programming Pendant

### 1.2.2 Key Description

1.2.2.1 Character Keys

The keys which have characters printed on them are denoted with []. For

example, [INTER] is shown as [ENTER].

The Numeric keys have additional functions along with their number values. Dual function keys are used in the context of the operation being

performed. For example:  $\begin{bmatrix} 1 \\ TIMER \end{bmatrix}$  may be described in the text as [1] or [TIMER].

### 1.2.2.2 Symbol Keys

The keys which have a symbol printed on them are not denoted with [] but depicted with a small picture, with the exception of the cursor key, which is not shown with a picture.

1.2.2.3 Axis Keys and Numeric Keys

The keys pictured in the following are referred to as the axis keys and Numeric keys when described.

1.2.2.4 Keys Pressed Simultaneously

When two keys are to be pressed simultaneously, the keys are shown with a "+" sign between them, such as [SHIFT]+[COORD].

1.2 Programming Pendant

### 1.2.3 Programming Pendant Keys

[START]	<ul> <li>Starts the manipulator motion in playback operation.</li> <li>The lamp on this button is lit during the play operation.</li> <li>The lamp also lights when the playback operation is started by the system input START signal.</li> <li>The lamp turns OFF when the playback operation is stopped by alarm occurrence, HOLD signal, or mode change.</li> </ul>	
[HOLD]	<ul> <li>Holds the manipulator motion.</li> <li>This button is enabled in any mode.</li> <li>The lamp on this button is lit only while the button is being pressed. Although the lamp turns OFF when the button is released, the manipulator stays stopped until a START command is input.</li> <li>The HOLD lamp automatically lights in the following cases to indicate that the system is in HOLD status. The start and axis operations are disabled while the lamp is lit.</li> <li>The HOLD request is being sent from an external device in remote mode.</li> <li>In the HOLD status caused by an error</li> </ul>	
E.STOP Button	<ol> <li>In the HOLD status caused by an error occurred in working process such as wire sticking at arc welding.</li> <li>Turns OFF the servo power.</li> </ol>	
Reference store	<ul> <li>When the servo power is turned OFF, the SERVO ON LED on the programing pendant will extinguish.</li> <li>An emergency stop message is displayed on the screen.</li> </ul>	
[MODE]	Selects the Play mode, Teach mode, or Remote mode.	
EEMOIE O ELAY UEACH	PLAY: Play ModeThe playback of taught job is enabled.The START signal from an external device is disabled.TEACH: Teach ModeThe axis operation and edition from the programmingpendant are enabled.The START signal from an external device is disabled.REMOTE: Remote Mode	
	The operation by external signals is enabled. [START] is invalid during the remote mode.	

## Spot and Arc Welding Using Motor Gun

- 1 Introduction
- 1.2 Programming Pendant

Enable Switch	<b>Turns ON the servo power.</b> The Enable switch is active only when the SERVO ON LED is blinking, the safety plug is ON, and the Mode Switch is set to "TEACH". When this switch is lightly squeezed, the power turns ON. When firmly squeezed, the power turns OFF.		
[SELECT]	Works as described below.		
	Selects menu items in the main menu area and		
SELECT	the pull-down menu area.		
	Makes the selected item ready to be set in the		
	general-purpose display area.		
	Displays multiple messages in the message		
	area.		
Cursor	<ul><li>Moves the cursor in the direction of the arrow.</li><li>The size of the cursor and the range/place</li></ul>		
	where the cursor can move will vary depending		
	on the window.		
	• If the UP cursor button is pressed when the		
	cursor is on the first line, the cursor will move to		
	the last line of the job. Conversely, if the cursor		
	is on the last line of the job and the DOWN		
	cursor button is pressed, the cursor will jump to		
	the first line of the job.		
	[SHIFT] + UP		
	Scrolls the screen upward.		
	[SHIFT] + DOWN Scrolls the screen downward.		
	[SHIFT] + RIGHT		
	Scrolls the screen to the right.		
	[SHIFT] + LEFT		
	Scrolls the screen to the left.		
[MAIN MENU]	Displays the main menu. If this button is pressed while the main menu is		
MAIN MENU	displayed, the main menu disappears.		
	[MAIN MENU] + UP		
	Increases the brightness of the screen.		
	[MAIN MENU] + DOWN Decreases the brightness of the screen.		
[SIMPLE MENU]	<b>Displays the simple menu.</b> If this button is pressed while the simple menu is displayed, the simple menu disappears.

										Enter

When the focus is in a text field of [Result], it is able to move a cursor position by pressing [Shift]+[ $\rightarrow$ ] or [Shift]+[ $\leftarrow$ ].

- 1 Introduction
- 1.2 Programming Pendant

#### 1.2.6.5 Register Word Function

This function enables to use the registered word when input a character by registering the word (character string) in advance.

To use this function simplifies to input the same character strings. It is able to register the 32 words of eight characters.

There is a limit to enter the character by input contents. If a registered word includes a limited character, it is unable to use the word.

e.g. Unable to use the lower case characters, a decimal point and symbols to the job name.

Select {SET WORD} from {SETUP} in the main menu.

- Register word window is displayed
- The registered words are displayed in the word area.
- If there is not any registered word, unable to select [Name order], [Delete] and [Delete All] in the button area.

### Word Registration

It is able to register the 32 words of eight characters. Register a word by selecting [REGISTER WORD] button while the word editing is valid (S2C410=1) during using the keyboard, or register the word in the word register screen.

e.g. Register the word "TEST".

Select [KEYBORD].

Enter [TEST] by using the keyboard, and select [Regist].

- The dial box appears.

DATA	EDIT	DISPLAY	UTILITY	12 🗹	M 😵 🔟 [	3 († 🖻

## Back Space

Delete the last character of the input character string.

Select [Back space] in the word register screen.

- Delete the last character of the input character string.

### Cancel

Cancel the input character string.

Select [Cancel] in the word register screen.

- Cancel the character string if there is a character string is input.
- End the word register screen if there is not any character string.

# Spot and Arc Welding Using Motor Gun

- 1.2 Programming Pendant

## Use of Words

e.g. Use the registered word [TEST].

Select [REGISTER WORD].

- The word area is displayed.

There is a limit to enter the character by input contents. If a registered word includes a limited character, it is unable to use the word.

e.g. Unable to use the lower case characters, a decimal point and symbols to the job name.

Select [Yes].

- The all words are deleted.

- 1 Introduction
- 1.3 Mode

### 1.3 Mode

The following three modes are available for DX100.

- Teach Mode
- Play Mode
- Remote Mode

#### 1.3.1 Teach Mode

In the teach mode, the following can be done.

- Preparation and teaching of a job
- Modification of a registered job
- Setting of various characteristic files and parameters

#### 1.3.2 Play Mode

In the play mode, the following can be done.

- Playback of a taught job
- Setting, modification, or deletion of various condition files

#### 1.3.3 Remote Mode

In the remote mode, the operations such as Servo ON Ready, Start, Cycle Change, Call Master Job can be commanded by external input signals.

The operations by external input signals become enabled in the remote mode, while [START] on the programming pendant becomes disabled.

The data transmission function (optional function) is also available in the remote mode.

The following table shows how each operation is input in each mode.

Mode	Teach Mode	Play Mode	Remote Mode
Operation			
Servo ON Ready	PP	PP	External input signal
Start	Invalid	PP	External input signal
Cycle Change	PP	PP	External input signal
Call Master Job	PP	PP	External input signal

Note: "PP" indicates the programming pendant.

#### 1.3.4 Teach Mode Priority

In the teach mode, following operations are disabled:

- 1. Playback using [START].
- 2. Playback from external input signals.

# Spot and Arc Welding Using Motor Gun

- 1 Introduction
- 1.4 Security Mode

## 1.4 Security Mode

## 1.4.1 Types of Security Modes

The following three types of security modes are available for DX100.

Any operation in the edit mode and the management mode requires a password. The password must contain between 4 and 8 letters, numbers, or symbols.

Operation Mode

The operator can monitor the line operation and start and stop the manipulator. Repairs, etc. can be performed if any abnormalities are detected.

Edit Mode

Teaching, robot jog operations, and editing of jobs and various condition files can be performed in addition to the operations enabled in the operation mode.

Management Mode

The operator who performs setup and maintenance for the system can set the machine control parameter, set the time, change the password, etc. in addition to the operations enabled in the edit mode. 1 Introduction

ID is input, the security mode is changed.

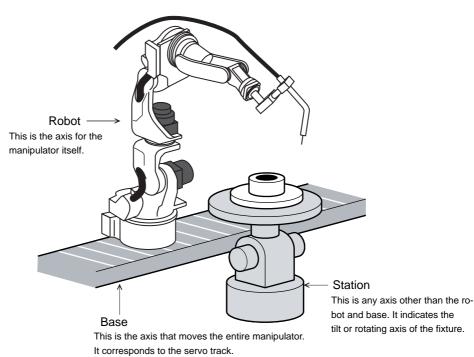

- 2 Manipulator Coordinate Systems and Operations
- 2.1 Control Groups and Coordinate Systems

## 2 Manipulator Coordinate Systems and Operations

## 2.1 Control Groups and Coordinate Systems

#### 2.1.1 Control Group

For the DX100, a group of axes to be controlled at a time is called "Control Group", and the group is classified into three units: "ROBOT" as a manipulator itself, "BASE" that moves the manipulator in parallel, and "STATION" as jigs or tools other than "ROBOT" and "BASE". BASE and STATION are also called external axes.

It controls the path of traveling manipulators.

# Spot and Arc Welding Using Motor Gun

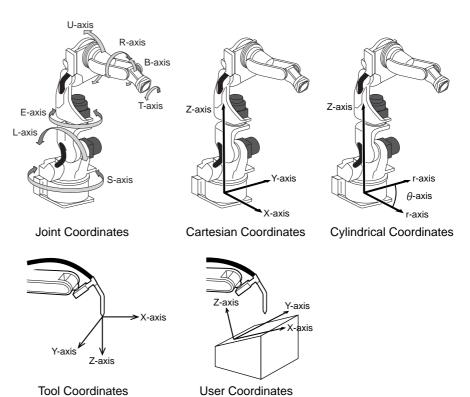

- 2 Manipulator Coordinate Systems and Operations
- 2.1 Control Groups and Coordinate Systems

## 2.1.2 Types of Coordinate Systems

The following coordinate systems can be used to operate the manipulator:

- Joint Coordinates Each axis of the manipulator moves independently.
- Cartesian Coordinates The tool tip of the manipulator moves parallel to any of the X-, Y-, and Z-axes.
- Cylindrical Coordinates The  $\theta$  axis moves around the S-axis. The R-axis moves parallel to the L-axis arm. For vertical motion, the tool tip of the manipulator moves parallel to the Z-axis.
- Tool Coordinates The effective direction of the tool mounted in the wrist flange of the manipulator is defined as the Z-axis. This axis controls the coordinates of the end point of the tool.
- User Coordinates

The XYZ-cartesian coordinates are defined at any point and angle. The tool tip of the manipulator moves parallel to the axes of them.

- 2 Manipulator Coordinate Systems and Operations
- 2.2 General Operations

## 2.2 General Operations

#### 2.2.0.1 Check Safety

Before any operation of the DX100, read *Section 1 "Safety" of "DX100 INSTRUCTIONS"* again and keep safe around the robot system or peripherals.

#### 2.2.0.2 Select Teach Mode

Set the mode switch on the programming pendant to "teach".

#### 2.2.0.3 Select Control Group

If the DX100 has several Control Groups or Coordinate Control Systems (optional function), select control group first.

If two or more ROBOT, BASE, STATION are registered, switch control group by pressing [SHIFT] + [ROBOT] or [SHIFT] + [EX. AXIS].

After selecting a job, the control group registered in the selected job is enabled. The control group registered in the edit job can be switched by pressing [ROBOT] or [EX. AXIS].

Check the selected control group at the status display area on the programming pendant.

#### 2.2.0.4 Select Coordinate System

Select a coordinate system by pressing [COORD] key.

Each time [COORD] key is pressed, the coordinate system switches in the following order:

Joint  $\rightarrow$  Cartesian (Cylindrical)  $\rightarrow$  Tool  $\rightarrow$  User.

Check the selected coordinate on the status display area on the programming pendant.

Spot and Arc Welding
Using Motor Gun

2 Manipulator Coordinate Systems and Operations

2.2 General Operations

#### 2.2.0.5 Select Manual Speed

Select manual speed of operation by pressing [FAST] or [SLOW]. The selected speed is effective not only for axis operation but [FWD] or [BWD] operation.

In operating the manipulator manually by the programming pendant, the maximum speed of center point is limited at 250 mm/s.

• Each time [FAST] is pressed, the speed switches in the order of "INCH"→"SLOW"→"MED"→"FAST".

- Each time [SLOW] is pressed, the speed switches in the order of "FAST"→"MED"→"SLOW"→"INCH".

Check selected manual speed on the status area of Programming Pendant.

2.2.0.6	Servo ON	
		Press [SERVO ON READY], then SERVO ON LED starts blinking.
		Squeeze the Enable switch, then SERVO ON LED starts lighting.
2.2.0.7	Axis Operation	
		Make sure of safety around the manipulator. Press axis key, then axis moves according to the selected control group, coordinates, and manual speed. See Section 2.3 "Coordinate Systems and Axis Operation" on page 2-5.
2.2.0.8	HIGH SPEED	
		Press [HIGH SPEED] while pressing an axis key to make the manipulator move faster than the usual speed.
		The [UICH SPEED] key is dischled when "INCH" is calested

The [HIGH SPEED] key is disabled when "INCH" is selected for the manual speed.

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

## 2.3 Coordinate Systems and Axis Operation

### 2.3.1 Joint Coordinates

When operating in joint coordinates mode, the S, L, U, R, B, and T-axes of the manipulator move independently. The motion of each axis is described in the table below.

Table 2-1: Axis Motion in Joint Coordinates

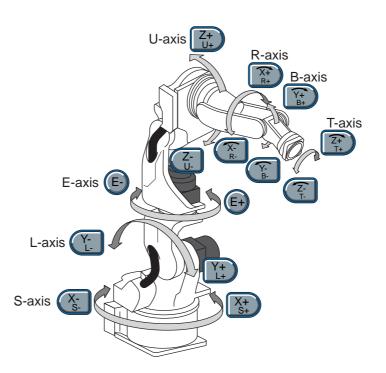

Axis Name		Axis Operation Key	Motion
Major Axes			Main unit rotates right and left.
	L-axis	Y- L- Y+	Lower arm moves forward and backward.
	U-axis	Z- U- U+ U+	Upper are moves up and down.
Wrist Axes	R-axis	X- R- X+ R+	Wrist rolls right and left.
	B-axis	Y- B- Y+ B+	Wrist moves up and down.
	T-axis	Z- T- T+	Wrist turns right and left.
	E-axis	(E-) (E+)	Lower arm turns right and left.

• When two or more axis keys are pressed at the same time, the manipulator will perform a compound movement. However, if two different directional keys for the same axis are pressed at the same time (such as [S-] + [S+]), none of the axes operate.

# Spot and Arc Welding Using Motor Gun

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

#### 2.3.2 Cartesian Coordinates

In the cartesian coordinates, the manipulator moves parallel to the X-, Y-, or Z-axes. The motion of each axis is described in the table below.

Table 2-2: Axis Motion in Cartesian Coordinates

Axis Name		Axis Operation Key Motion	
Basic Axes	X-axis	X- S- X+ S+	Moves parallel to X-axis.
	Y-axis	Y- L- L+	Moves parallel to Y-axis.
	Z-axis	Z- U- U+ U+	Moves parallel to Z-axis.
Wrist Axes		Motion about TCP is executed. See Section 2.3.7 "Control Point Operation" on page 2-15.	

2 Manipulator Coordinate Systems and Operations

2.3 Coordinate Systems and Axis Operation

• When two or more axis keys are pressed at the same time, the manipulator will perform compound movement. However, if two different directional keys for the same axis are pressed at the same time (such as [X-] + [X+]), none of the axes operate.

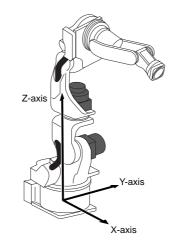

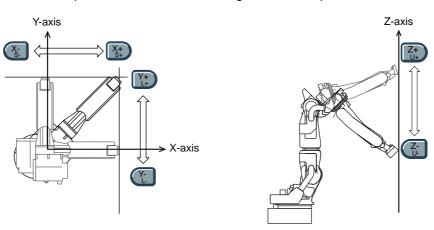

Fig. 2-1: Moves parallel to X- or Y-axis Fi

Fig. 2-2: Moves parallel to Z-axis

# Spot and Arc Welding Using Motor Gun

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

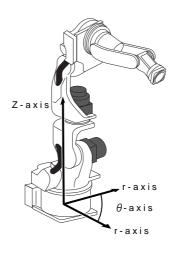

#### 2.3.3 Cylindrical Coordinates

In the cylindrical coordinates, the manipulator moves as follows. The motion of each axis is described in the table below.

Table 2-3: Axis Motion in Cylindrical Coordinates

Axis Name		Axis Operation Key	Motion
Basic Axes	θ-axis	X- S- X+ S+	Main unit rolls around S-axis.
	r-axis	Y- L- L+	Moves perpendicular to Z- axis.
	Z-axis	Z- U- U+	Moves parallel to Z-axis.
Wrist Axes		Motion about TCP is executed. See Section 2.3.7 "Control Point Operation" on page 2-15.	

• When two or more axis keys are pressed at the same time, the manipulator will perform compound movement. However, if two different directional keys for the same axis are pressed at the same time (such as [Z-] + [Z+]), none of the axes operate.

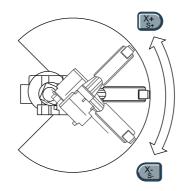

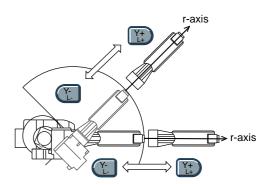

Fig. 2-4: Moves perpendicular to r-axis

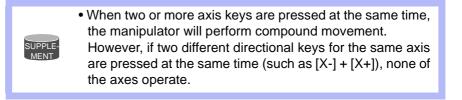

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

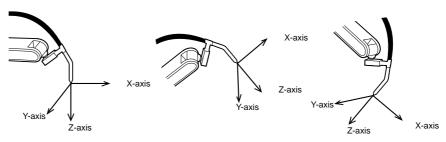

### 2.3.4 Tool Coordinates

In the tool coordinates, the manipulator moves parallel to the X-, Y-, and Zaxes, which are defined at the tip of the tool. The motion of each axis is described in the table below.

Table 2-4: Axis Motion in Tool Coordinates

Axis Name		Axis Operation Key Motion		
Basic Axes	X-axis	X- S- X+ S+	Moves parallel to X-axis.	
	Y-axis	Moves parallel to Y-axis.		
	Z-axis	Z- U- U+	Moves parallel to Z-axis.	
Wrist Axes		Motion about TCP is executed. See Section 2.3.7 "Cont Point Operation" on page 2-15.		

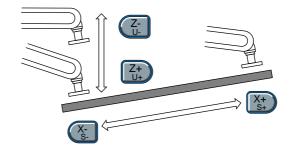

The tool coordinates are defined at the tip of the tool, assuming that the effective direction of the tool mounted on the manipulator wrist flange is the Z-axis. Therefore, the tool coordinates axis direction moves with the wrist.

In the tool coordinates motion, the manipulator can be moved using the effective tool direction as a reference regardless of the manipulator position or orientation. These motions are best suited when the manipulator is required to move parallel while maintaining the tool orientation with the workpieces.

Spot and Arc Welding Using Motor Gun

2 Manipulator Coordinate Systems and Operations

2.3 Coordinate Systems and Axis Operation

For tool coordinates, the tool file should be registered in advance. For further details, refer to "8.3 Tool Data Setting" of coordinates "DX100 INSTRUCTIONS" (162536-1CD).

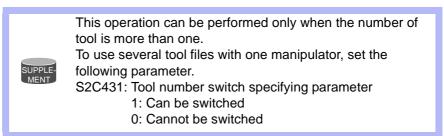

### Spot and Arc Welding Using Motor Gun

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

### 2.3.4.1 Selecting Tool

Tool numbers are used to specify a tool when more than one tool is used on the system.

You may select from the registered tool files when you switch tools on the manipulator.

- 1. Press the [COORD] key and select the tool coordinates
  - Each time [COORD] key is pressed, the coordinate system switches in the following order: Joint→Cartesian (Cylindrical)→Tool→User. Check the change on the status display area.
- 2. Press [SHIFT] + [COORD].
  - The TOOL NO. SELECT window appears.

- 4. Press [SHIFT] + [COORD].
  - The window goes back to the previous window.

# Spot and Arc Welding Using Motor Gun

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

### 2.3.5 User Coordinates

In the user coordinates, the manipulator moves parallel to each axis of the coordinates which are set by the user. Up to 24 coordinate types can be registered. Each coordinate has a user number and is called a user coordinate file.

The figure and the table below describe the motion of each axis when the axis key is pressed.

Table 2-5: Axis Motion in User Coordinates

Axis Na	me	Axis Operation Key	Motion	
Basic Axes	X-axis	X- S- X+ S+	Moves parallel to X-axis.	
	Y-axis	Y- L- +	Moves parallel to Y-axis.	
	Z-axis	Z- U- U+ U+	Moves parallel to Z-axis.	
Wrist Axes		Motion about TCP is executed. See Section 2.3.7 "Control Point Operation" on page 2-15.

- 2.3 Coordinate Systems and Axis Operation

### 2.3.5.1 Selecting User Coordinates

Follow these procedures to select the desired coordinate system from among the registered user coordinates.

- 1. Press [COORD] to select the user coordinates  $\bigvee$ 
  - Each time [COORD] key is pressed, the coordinate system switches in the following order: Joint→Cartesian (Cylindrical)→Tool→User. Check the change on the status display area.
- 2. Press [SHIFT] + [COORD].
  - The USER COORD SELECT window appears.

DATA	EDIT	DISPLAY	UTILITY	12 😕 네 👒 🐻 🕞 👆

For more information on registration of the user coordinates, refer to "8.8 User Coordinate Setting" of "DX100 INSTRUCTIONS" (162536-1CD).

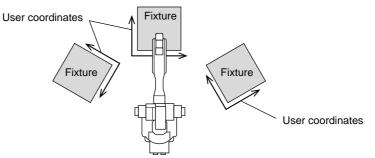

3. Select the desired user number.

163543-1CD	
Spot and Arc Welding Using Motor Gun	<ol> <li>Manipulator Coordinate Systems and Operations</li> <li>Coordinate Systems and Axis Operation</li> </ol>

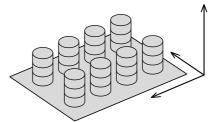

2.3.5.2 Examples of User Coordinate Utilization

The user coordinate settings allow easy teaching in various situations. For example:

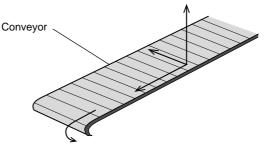

• When multiple positioners are used, manual operation can be simplified by setting the user coordinates for each fixture.

• When performing arranging or stacking operations, the incremental value for shift can be easily programmed by setting user coordinates on a pallet.

• When performing conveyor tracking operations, the moving direction of the conveyor is specified.

### 2.3.6 External Axis

The external axis can be operated by selecting "BASE" or "STATION" for the control group. The motion of each axis is described in the table below.

Axis Name		Axis Operation Key	Motion	
BASE or STATION	1st axis	X- S- X+ S+	The 1st axis moves.	
	2nd axis	Y- L- L+	The 2nd axis moves.	
	3rd axis	Z- U- U+	The 3rd axis moves.	

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

### 2.3.7 Control Point Operation

Motion about TCP (Tool Center Point) can only change the wrist orientation at a fixed TCP position in all coordinate systems except the joint coordinates. The motion of each axis is described in the table below.

Table 2-6: Axis Motion in Motion about TCP

Axis Name	Axis Operation Key	Motion	
Major Axes	X- S- X+ S+	TCP moves. These movements differ depending on cartesian, cylindrical, tool and user coordinates.	
	Y- L- L+		
	Z- U- U+ U+		
Wrist Axes	(X- R- X+ R+	Wrist axes move with the TCP fixed. These movements differ depending on cartesian,	
	(Y- B- (Y+ B+	cylindrical, tool and user coordinates.	
	(Z- T- T+		
E-axis	(E-) (E+)	* Available only for the manipulator with seven axes The posture of arm changes while the position and posture of the tool remain fixed. (The Re degree changes.)	

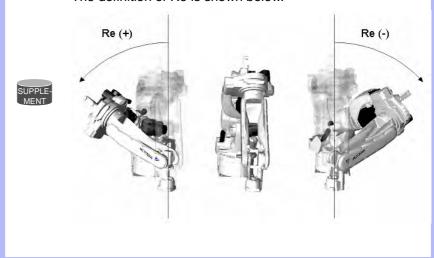

SUPPLE- MENT	<ul> <li>When two or more axis keys are pressed at the same time, the manipulator will perform compound movement. However, if two different directional keys for the same axis are pressed at the same time (such as [X-] + [X+]), none of the axes operate.</li> </ul>
-----------------	---

# Spot and Arc Welding Using Motor Gun

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

Re is an element to indicate the posture of the manipulator with seven axes and does not change by the specified coordinates.

The definition of Re is shown below.

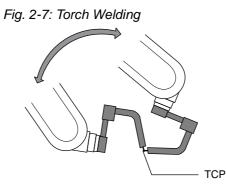

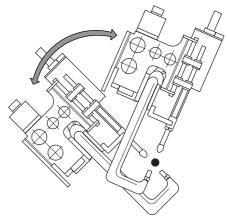

Fig. 2-8: Gun Spot Welding

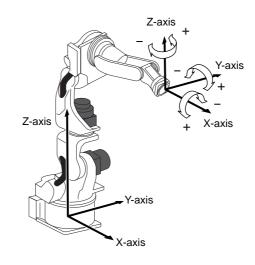

Spot and Arc Welding Using Motor Gun

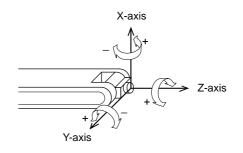

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

Turning of each wrist axis differs in each coordinate system.

• In cartesian or cylindrical coordinates, wrist axis rotations are based on the X-, Y-, or Z-axis.

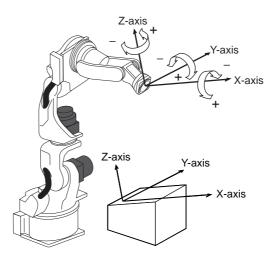

• In tool coordinates, wrist axis rotations are based on X-, Y-, or Z-axis of the tool coordinates.

## Spot and Arc Welding Using Motor Gun

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation
  - In user coordinates, wrist axis rotations are based on X-, Y-, or Z-axis of the user coordinates.

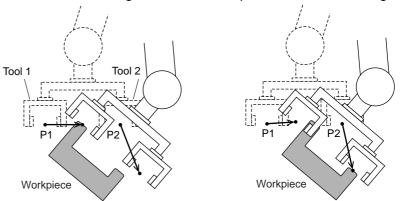

### 2.3.7.1 Control Point Change

The tool tip position (TCP) is the target point of axis operations and is set as the distance from the flange face. The control point change operation is an axis operation that involves selecting a tool from the list of registered tools (Refer to Section 2.3.4.1 "Selecting Tool" on page 2-11), and then manipulating the axes while changing the TCP. This can be performed with all coordinates except the joint coordinates. The axis operation is the same as that of the motion about TCP.

<Example 1>TCP Change Operation with Multiple Tools

- (1) Set the TCPs for Tool 1 and Tool 2 as P1 and P2, respectively.
- (2) When Tool 1 is selected to perform an axis operation, P1 (Tool 1's TCP) is the target point of the operation. Tool 2 follows Tool 1 and is not controlled by the axis operation.
- (3) On the other hand, When Tool 2 is selected to perform an axis operation, P2 (Tool 2's TCP) is the target point of the axis operation. In this case, Tool 1 just follows Tool 2.

Fig. 2-9: Selection of Tool 1 and axis Fig. 2-10: Selection of Tool 2 and operations with controlling P1 axis operations with controlling P2

# Spot and Arc Welding Using Motor Gun

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

<Example 2>TCP Change Operation with a Single Tool

- (1) Set the two corners of the workpiece that the tool is holding as TCP P1 and P2 respectively.
- (2) By selecting two TCPs alternately, the workpiece can be moved as shown below:

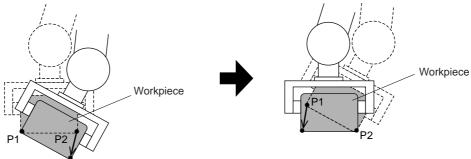

Fig. 2-12: Motion about TCP with P2 selected

For registration of the tool file, refer to "8.3 Tool Data Setting" of "DX100 INSTRUCTIONS" (162536-1CD).

Spot and Arc Welding Using Motor Gun

- 3 Teaching
- 3.1 Preparation for Teaching

## 3 Teaching

## 3.1 Preparation for Teaching

To ensure safety, the following operations should always be performed before teaching:

- Check the emergency stop buttons to be sure they function properly.
- Set the mode switch to "TEACH".

Then,

• Register a job.

### 3.1.1 Checking Emergency Stop Buttons

The Servo ON button on the programming pendant should be lit while the power is ON for the servo system. Perform the following operation to ensure that the emergency stop buttons on both the DX100 and the programming pendant are functioning correctly before operating the manipulator.

- 1. Press E. STOP button.
  - Press the emergency stop button on the DX100 or the programming pendant.
- 2. Confirm the servo power is turned OFF.
  - The SERVO ON button on the programming pendant lights while servo supply is turned ON.
  - When the emergency stop button is pressed and the servo power is turned OFF, the SERVO ON lamp will turn OFF.
- 3. Press [SERVO ON READY] of the programming pendant.
  - After confirming correct operation, press [SERVO ON READY]. The servo power will be ready to turn ON.
  - The servo power can be turned ON while the SERVO ON button lamp blinks.

### 3.1.2 Setting the Teach Lock

For safety purposes, always set the mode switch to "TEACH" before beginning to teach.

While the teach lock is set, the mode of operation is tied to the teach mode and the machines cannot be played back using either [START] or external input.

- 3 Teaching
- 3.1 Preparation for Teaching

### 3.1.3 Registering a Job

Specify the name, comments (as required), and control group to register a job.

### 3.1.3.1 Registering Job Names

Job names can use up to 32 alphanumeric and symbol characters. These different types of characters can coexist within the same job name.

The following rules apply to the designation of job names:

- A maximum of 32 characters can be used for a job name.
- If the job name is already used, an input error is caused.

### <Example>

### 3.1.3.2 Registering Jobs

- 1. Select {JOB} under the main menu.
  - The sub-menu appears.

		12 🗹 🐋 🐻 寻 🙌
JOB DOUT MOVE	JOB	n Menu.
ARC WELDING	SELECT JOB	
VARIABLE B001	CREATE NEW JOB

- 3. Input job name.
  - Move the cursor to JOB NAME, and press [SELECT]. Input job names using the character input operation. For information on character input operation, refer to Section 1.2.6 "Character Input Operation" on page 1-18.
- 4. Press [ENTER].

### 3.1.3.3 Registering Comments

Register a comment using up to 32 alphanumeric and symbol characters as required.

- 1. Enter a comment.
  - In the NEW JOB CREATE window, move the cursor to the comment and press [SELECT]. For information on character input operation, refer to Section 1.2.6 "Character Input Operation" on page 1-18.
- 2. Press [ENTER].

### 3.1.3.4 Registering Control Groups

Select the control group that has been registered in advance. If external axes (BASE or STATION) or multiple robot systems are not used, the registration of control groups is not required.

- 3 Teaching
- 3.1 Preparation for Teaching

### 3.1.3.5 Switching to the Teaching Window

After the name, comments (can be omitted), and the control groups have been registered, switch the window to the teaching window as follows.

- 1. In the NEW JOB CREATE window, press [ENTER] or select "EXECUTE".
  - Job name, comments, and control groups are all registered. Then, the JOB CONTENT window appears. NOP and END instructions are automatically registered.

# Spot and Arc Welding Using Motor Gun

- 3 Teaching
- 3.2 Teaching Operation

## 3.2 Teaching Operation

### 3.2.1 Teaching Window

Teaching is conducted in the JOB CONTENT window. The JOB CONTENT window contains the following items:

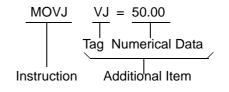

### A. Line Numbers

The number of the job line is automatically displayed. Line numbers are automatically updated if lines are inserted or deleted.

### **B.** Cursor

The cursor for manipulator control. For the FWD, BWD, and test operation, the manipulator motion starts from the line this cursor points.

### C. Instructions, Additional Items, Comments, Etc.

- Instructions : These are instructions needed to process or perform an operation. In the case of MOVE instructions, the instruction corresponding to the interpolation type is automatically displayed at the time position is taught.
- Additional items : Speed and time are set depending on the type of instruction. When needed, numerical or character data is added to the condition-setting tags.

- 3 Teaching
- 3.2 Teaching Operation

### 3.2.2 Interpolation Type and Play Speed

Interpolation type determines the path along which the manipulator moves between playback steps. Play speed is the rate at which the manipulator moves.

Normally, the position data, interpolation type, and play speed are registered together for a robot axis step. If the interpolation type or play speed settings are omitted during teaching, the data used from the previously taught step is automatically used.

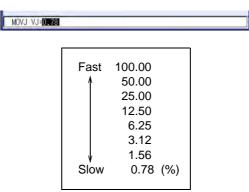

#### 3.2.2.1 Joint Interpolation

The joint interpolation is used when the manipulator does not need to move in a specific path toward the next step position. When the joint interpolation is used for teaching a robot axis, the move instruction is MOVJ. For safety purposes, use the joint interpolation to teach the first step.

When [MOTION TYPE] is pressed, the move instruction on the input buffer line changes.

<Play Speed Setting Window>

- Speeds are indicated as percentages of the maximum rate.
- Setting "0:Speed Omit" sets the same speed as the previous determination.
- 1. Move the cursor to the play speed.
- 2. Set the play speed by pressing [SHIFT] + the cursor key.
  - The joint speed value increases or decreases.

# Spot and Arc Welding Using Motor Gun

- 3 Teaching
- 3.2 Teaching Operation

### 3.2.2.2 Linear Interpolation

The manipulator moves in a linear path from one taught step to the next. When the linear interpolation is used to teach a robot axis, the move instruction is MOVL. Linear interpolation is used for work such as welding. The manipulator moves automatically changing the wrist position as shown in the figure below.

~|~/

<Play Speed Setting Window (same for circular and spline interpolation)>

- There are two types of displays, and they can be switched depending on the application.
- 1. Move the cursor to the play speed.
- 2. Set the play speed by pressing [SHIFT] + the cursor key.
  - The play speed value increases or decreases.

MOVL V=66	
Fast 1500.0	Fast 9000
↑ 750.0	↑ 4500
375.0	2250
187.0	1122
93.0	558
46.0	276
↓ 23.0	↓ 138
Slow 11 (mm/s)	Slow 66 (cm/min)

3 Teaching

3.2 Teaching Operation

#### 3.2.2.3 Circular Interpolation

The manipulator moves in an arc that passes through three points. When circular interpolation is used for teaching a robot axis, the move instruction is MOVC.

#### ■ Single Circular Arc

When a single circular movement is required, teach the circular interpolation for three points, P1 to P3, as shown in the following figure. If joint or linear interpolation is taught at P0, the point before starting the circular operation, the manipulator moves from P0 to P1 in a straight line.

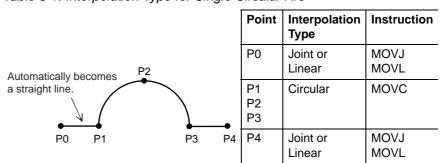

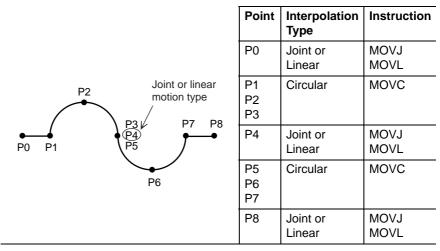

Table 3-1: Interpolation Type for Single Circular Arc

### Continuous Circular Arcs

As shown below, when two or more successive circular movements with different curvatures are required, the movements must be separated from each other by a joint or linear interpolation step. This step must be inserted between the steps at an identical point. The step at the end point of the preceding circular movement must coincide with the beginning point of the following circular movement.

Table 3-2: Interpolation Type for Continuous Circular Arcs

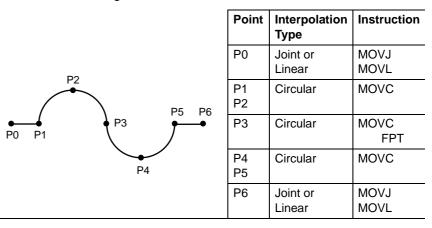

## Spot and Arc Welding Using Motor Gun

3 Teaching

3.2 Teaching Operation

Alternatively, to continue movements without adding an extra joint or linear interpolation step in between, add "FPT" tag to the step whose curvature is needed to be changed.

<Play Speed>

- The play speed set display is identical to that for the linear interpolation.
- The speed taught at P2 is applied from P1 to P2. The speed taught at P3 is applied from P2 to P3.
- If a circular operation is taught at high speed, the actual arc path has a shorter radius than that taught.

### 3.2.2.4 Spline Interpolation

When performing operations such as welding, cutting, and applying primer, using the spline interpolation makes teaching for workpieces with irregular shapes easier. The path of motion is a parabola passing through three points. When spline interpolation is used for teaching a robot axis, the move instruction is MOVS.

### Single Spline Curve

When a single spline curve movement is required, teach the spline interpolation for three points, P1 to P3, as shown in the figure below. If joint or linear interpolation is taught at point P0, the point before starting the spline interpolation, the manipulator moves from P0 to P1 in a straight line.

	Point	Interpolation Type	Instruction
P2	P0	Joint or Linear	MOVJ MOVL
Automatically becomes a straight line.	P1 P2 P3	Spline	MOVS
•	P4	Joint or Linear	MOVJ MOVL

Table 3-3: Interpolation Type for Single Spline Curve

### Spot and Arc Welding Using Motor Gun

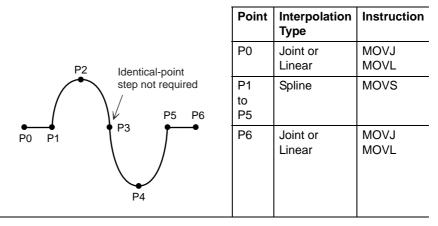

3 Teaching

3.2 Teaching Operation

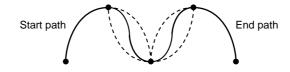

### **Continuous Spline Curves**

The manipulator moves through a path created by combining parabolic curves. This differs from the circular interpolation in that steps with identical points are not required at the junction between two spline curves.

Table 3-4: Interpolation Type for Continuous Spline Curves

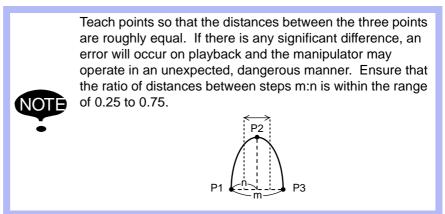

When the parabolas overlap, a composite motion path is created.

<Play Speed>

- The play speed setting window is identical to that for the linear interpolation.
- As with the circular interpolation, the speed taught at P2 is applied from P1 to P2, and the speed taught at P3 is applied from P2 to P3.

## Spot and Arc Welding Using Motor Gun

3 Teaching

3.2 Teaching Operation

### 3.2.3 Teaching Steps

### 3.2.3.1 Registering Move Instructions

Whenever one step is taught, one move instruction is registered. There are two ways to teach a step. Steps can be taught in sequence as shown in the following left figure *Fig.3-1 Registering Move Instructions* or they can be done by inserting steps between already registered steps, as shown in the right figure *Fig.3-2 Inserting Move Instructions* 

This paragraph explains the teaching of *Fig.3-1 Registering Move Instructions*, the operations involved in registering new steps.

Teaching of *Fig.3-2 Inserting Move Instructions* is called "Inserting move instruction", to distinguish it from the method shown in *Fig.3-1 Registering Move Instructions*. For more details on this operation, see *Section 3.4.2* "*Inserting Move Instructions*" on page 3-32. The basic operations for registration and insertion are the same. The only difference is pressing [INSERT] in the case of insertion. For registration (*Fig.3-1 Registering Move Instructions*), the instruction is always registered before the END instruction. Therefore, it is not necessary to press [INSERT] must be pressed.

## Setting the Position Data

- 1. Select {JOB} under the main menu.
  - The sub-menu appears.

- 3 Teaching
- 3.2 Teaching Operation
- 2. Select {JOB}.
  - The contents of the currently-selected job is displayed.

LE-	<ul> <li>When multiple tools are to be used with one manipulator, set parameter S2C431 to 1.</li> </ul>
	<ul> <li>See Section 2.3.4 "Tool Coordinates" on page 2-9 for</li> </ul>

- Setting the Interpolation Type
  - 1. Press [MOTION TYPE].
  - 2. Select the desired interpolation type.
    - When [MOTION TYPE] is pressed, MOVJ → MOVL → MOVC → MOVS are displayed in order in the input buffer line.

## Setting the Play Speed

1. Move the cursor to the instruction.

0000	NOP		
0001	MOVJ	VJ=0.78	
0002	END		

- 2. Press [SELECT].
  - The cursor moves to the input buffer line.

4. Press [SHIFT] + the cursor key [ $\uparrow$ ] or [ $\downarrow$ ] simultaneously.

- The joint speed moves up and down.

MOXU VJ=0.78

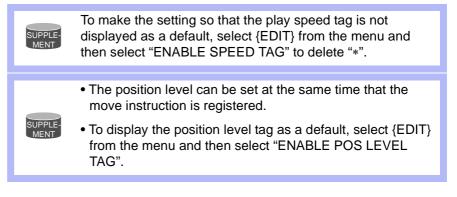

5. Press [ENTER].

- The MOV instruction is registered.

MOVJ VJ=50.00

0000 NOP + 0001 MOVJ VJ=50.00 0002 END Move instruction is registered.

Follow the above instructions when conducting teaching. (Tool number, interpolation type, or play speed does not need to be set if it is same as the previous step.)

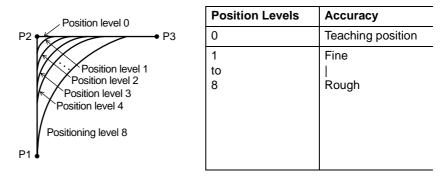

- 3 Teaching
- 3.2 Teaching Operation

**Position Level**: The position level is the degree of approximation of the manipulator to a taught position.

The position level can be added to move instructions MOVJ (joint interpolation) and MOVL (linear interpolation).

If the position level is not set, the precision depends on the operation speed. Setting an appropriate level moves the manipulator in a path suitable to circumferential conditions and the workpiece.

The relationship between path and accuracy for position levels is as follows.

Setting the Position Level

- 1. Select move instruction.
  - The DETAIL EDIT window appears.

JOB	EDIT	DISPLAY	UTILITY	12 🗹 🖬 😂 🛅 🗔 🔭

### 3.2.4 Overlapping the First and Last Steps

- 1. Move the cursor to the first step line.
- 2. Press [FWD].
  - The manipulator moves to the first step position.
- 3. Move the cursor to the last step line.
  - The cursor starts blinking.
  - When the cursor line position and the manipulator position are different in the JOB CONTENT window, the cursor blinks.
- 4. Press [MODIFY].
  - The key lamp lights.
- 5. Press [ENTER].
  - The position data for the first step is registered on the line of the last step.
  - At this time, only the position data can be changed in the last step. Interpolation type and play speed do not change.

# Spot and Arc Welding Using Motor Gun

- 3 Teaching
- 3.3 Checking Steps

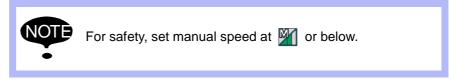

## 3.3 Checking Steps

### 3.3.1 FWD/BWD Key Operations

Check whether the position of the taught steps is appropriate using [FWD] or [BWD] on the programming pendant. Each time [FWD] or [BWD] is pressed, the manipulator moves by a single step.

[FWD]: Moves the manipulator ahead in step number sequence.Only the move instruction is executed when [FWD] is pressed.[INTERLOCK] + [FWD]: All instructions are executed alternately.

[BWD]: Moves the manipulator backward a step at a time in reverse step number sequence. Only the move instruction is executed.

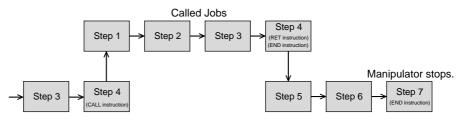

- 1. Move the cursor to the step to be checked.
- 2. Press [FWD] or [BWD].
  - The manipulator reaches the following / previous step and stops.

- 3 Teaching
- 3.3 Checking Steps

### 3.3.1.1 Precautions When Using FWD / BWD Operations

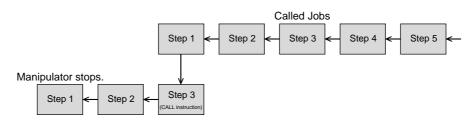

### FWD Movements

- The manipulator moves in step number sequence. Only move instructions are executed when [FWD] is pressed. To execute all instructions, press [INTERLOCK] + [FWD].
- The manipulator stops after playing a single cycle. It does not move after the END instruction is reached, even if [FWD] is pressed. However, at the end of a called job, the manipulator moves the instruction next to the CALL instruction.

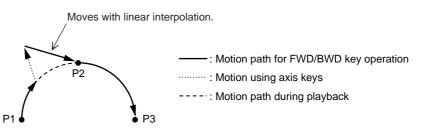

### BWD Movements

- The manipulator moves in reverse step number sequence. Only move instructions are executed.
- The manipulator does not move after the first step is reached, even if [BWD] is pressed. However, at the beginning of a called job, the manipulator moves to the instruction immediately before the CALL instruction.

#### Circular Movements with FWD/BWD Key Operations

- The manipulator moves in a straight line to the first step of the circular interpolation.
- There must be three circular interpolation steps in a row to move the manipulator in an arc.
- If [FWD] or [BWD] operation is restarted after being stopped to move the cursor or to perform search, the manipulator moves in a straight line to the next step.
- If [FWD] or [BWD] operation is restarted after being stopped to move the axis as shown below, the manipulator moves in a straight line to P2, the next circular interpolation. Circular motion is restored from P2 to P3.

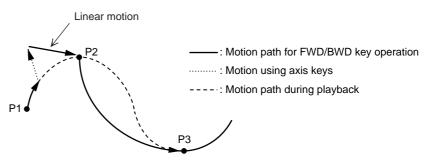

### Spot and Arc Welding Using Motor Gun

3 Teaching

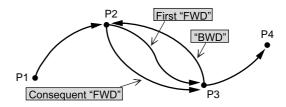

3.3 Checking Steps

### Spline Curve Movements with FWD/BWD Operations

- The manipulator moves in a straight line to the first step of spline interpolation.
- There must be three spline curve motion steps in a row to perform a spline curve operation.
- Depending on the position where the [FWD] / [BWD] operation is performed, the alarm "IRREGULAR DISTANCES BETWEEN TEACHING POINTS" may occur.
- Note that FWD/BWD inching operations change the path of the manipulator and **caution is therefore required**. Performing these operations also increases the likelihood that the "IRREGULAR DISTANCES BETWEEN TEACHING POINTS" will occur.
- If the [FWD] or [BWD] operation is restarted after being stopped to move the cursor or perform a search, the manipulator moves in a straight line to the next step.
- If the [FWD] or [BWD] operation is restarted after being stopped to move the axis as shown below, the manipulator moves in a straight line to P2, the next spline curve motion step. Spline curve motion is restored from P2 onward. However, the path followed between P2 and P3 is somewhat different from the path followed at playback.

• If the manipulator is moved to P3 with [FWD], stopped, and then returned to P2 with [BWD], the path followed between P2 and P3 is different for each of the following: the first FWD operation, the BWD operation, and the consequent FWD operation.

Spot and Arc Welding Using Motor Gun

- 3 Teaching
- 3.3 Checking Steps

### 3.3.1.2 Selecting Manual Speed

When [FWD] or [BWD] is pressed, the manipulator moves at the manual speed selected at that time. Selected manual speed can be checked by the manual speed indication on the programming pendant.

Manual speed is set with [FAST] and [SLOW]. FWD operation can be performed at a high speed by pressing [HIGH SPEED]. Follow these procedures to select a manual speed.

• Each time [FAST] is pressed, the speed switches in the order of "INCH"→"SLOW"→"MED"→"FAST".

• Each time [SLOW] is pressed, the speed switches in the order of "FAST"→"MED"→"SLOW"→"INCH".

- FWD/BWD operation is performed with SLW speed even if INCH is selected.
  - [HIGH SPEED] is available only for the FWD operation but not for BWD operation.

### 3.3.1.3 Moving to Reference Point

To check the position of a taught reference point, follow these procedures to move the manipulator to the reference point.

- 1. Move the cursor to the reference point instruction line to be checked.
- 2. Press [REFP] + [FWD].

- The manipulator moves to the reference point of the cursor line.

The programming pendant does not have the [REFP] key for the application of spot welding, general purposes (= material handling, assembling, cutting) or motor gun.

## Spot and Arc Welding Using Motor Gun

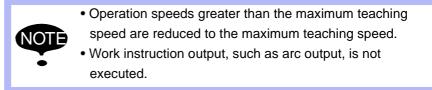

3 Teaching

3.3 Checking Steps

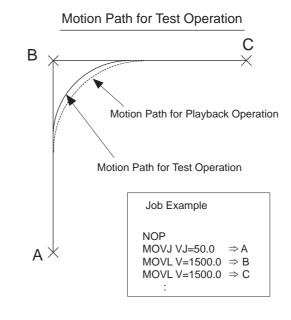

### 3.3.1.4 Test Operations

Playback operations can be simulated in the teach mode with test operations. This function is convenient for checking continuous paths and operation instructions.

Test operation differs in the following ways from actual playback in the play mode.

Note that the motion path for the playback operation is replayed during the test operation. Therefore, make sure that there is no obstacle around the manipulator and great caution should be exercised when the test operation is performed.

There may be a slight difference between the motion path for the test operation and the motion path for the playback operation due to a mechanical error or control delay, etc.

Test operation is performed by pressing [INTERLOCK] and [TEST START]. For safety purposes, these keys will only function while the keys are held down.

- 1. Select {JOB} under the main menu.
- 2. Press {JOB}.
  - The test operation JOB CONTENT window appears.

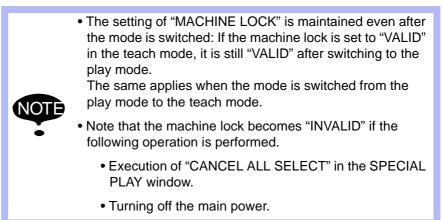

- 3 Teaching
- 3.3 Checking Steps
- 3. Press [INTERLOCK] + [TEST START].
  - The manipulator starts the test cycle operation.
  - However, after the operation starts, the motion continues even if [INTERLOCK] is released.
  - The manipulator moves only while these keys are held down.
  - The manipulator stops immediately when [TEST START] is released.

#### 3.3.1.5 Machine Lock Operation

When "MACHINE LOCK" is enabled, the [FWD] / [BWD] operation or the test operation can be performed to check the status of input and output without moving the manipulator.

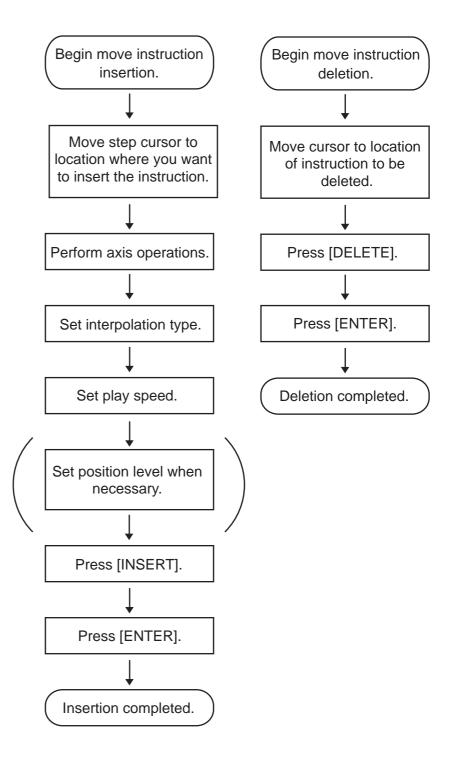

- 1. Press [AREA].
- 2. Select {UTILITY}.
- 3. Select {SETUP SPECIAL RUN}.
  - The SPECIAL TEACH window appears.
- 4. Select "MACHINE LOCK".
  - Press [SELECT] to switch "VALID" and "INVALID".

3. Select the job name to be called.

- 3 Teaching
- 3.4 Modifying Steps

#### 3.4.2 Inserting Move Instructions

Step where move instruction is to be inserted

1. Move the cursor to the line immediately before the insert position.

The line immediately-	0006	MOVL V=276
before where the	0007	TIMER T=1.00
move instruction	8000	DOUT OT#(1) ON
is to be added.	0009	MOVJ VJ=100.0

- 2. Press the axis operation key.
  - Turn ON the servo power and press the axis operation key to move the manipulator to the position to be inserted.

Confirm the move instruction on the input buffer line and set desired interpolation type and play speed.

- 3. Press [INSERT].
  - The key lamp will light.

When the inserting position is immediately before the END instruction, pressing [INSERT] is not needed.

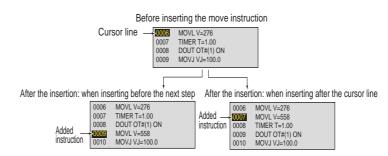

#### 4. Press [ENTER].

- The move instruction is inserted after the cursor line.

	0006	MOVL V=276
	0007	TIMER T=1.00
	8000	DOUT OT#(1) ON
The move instruction	0009	MOVL V=558
is added.	0010	MOVJ VJ=100.0

Spot and Arc Welding Using Motor Gun

- 3 Teaching
- 3.4 Modifying Steps
- 5. Press [ENTER].
  - <Examples of Inserting a Move Instruction>
  - When a move instruction is inserted in the following job, it is placed on different lines according to the setting in the TEACHING CONDITION window.

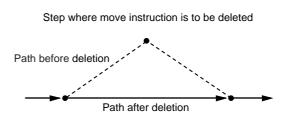

Positions where the move instructions are inserted.

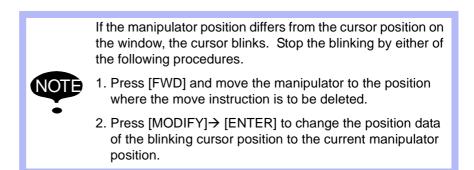

The default location for insertions is "before the next step", but it is also possible to insert "after the cursor line". This setting is made in the "Move Instruction Register Method" in the TEACHING CONDITION window.

### 3.4.3 Deleting Move Instructions

1. Move the cursor to the move instruction to be deleted.

Move instruction	003 004 005	MOVL V=138 MOVL V=558 MOVJ VJ=50.00
------------------	-------------------	---

- 3 Teaching
- 3.4 Modifying Steps
- 2. Press [DELETE].
  - The key lamp will blink.
- 3. Press [ENTER].
  - The step indicated by cursor line is deleted.

0003	MOVL V=138	
0004	MOVJ VJ=50.00	

#### 3.4.4 Modifying Move Instructions

#### 3.4.4.1 Modifying Position Data

- 1. Move the cursor to the MOV instruction to be modified.
  - Display the JOB CONTENT window and move the cursor to the move instruction to be changed.
- 2. Press the axis operation key.
  - Turn ON the servo power and press the axis operation key to move the manipulator to the desired position.
- 3. Press [MODIFY].
  - The key lamp will blink.
- 4. Press [ENTER].
  - The position data in the present position is registered.

For MOV instructions for which position variables have been set, the position variables will not be changed.

#### 3.4.4.2 Modifying Interpolation Type

Modifying only interpolation type is impossible. The interpolation type can be modified as a choice for modifying the position data.

- 1. Move the cursor to the move instruction to be modified.
  - Display the JOB CONTENT window, and move the cursor to the move instruction for which interpolation type is to be changed.
- 2. Press [FWD].
  - Turn ON the servo power and press [FWD] to move the manipulator to the position of the move instruction.
- 3. Press [DELETE].
  - The key lamp will blink.
- 4. Press [ENTER].
  - The cursor line step is deleted.

### Spot and Arc Welding Using Motor Gun

- 3 Teaching
- 3.4 Modifying Steps
- 5. Press [MOTION TYPE].
  - Press [MOTION TYPE] to change the interpolation type.
  - Each time [MOTION TYPE] is pressed, the input buffer line instruction alternates.
- 6. Press [INSERT].
- 7. Press [ENTER].
  - The interpolation type and position data are changed at the same time.

#### 3.4.5 Undo Operation

After inserting, deleting, or modifying an instruction, the operation can be undone.

The UNDO operation becomes enabled by selecting  $\{\text{EDIT}\} \rightarrow \{\text{ENABLE UNDO}\}\)$ , and becomes disabled by selecting  $\{\text{EDIT}\} \rightarrow \{\text{*ENABLE UNDO}\}\)$  while editing a job.

• The undo operation can be performed even after the manipulator is moved by the FWD or BWD operation or test operation after inserting, deleting, or modifying a move instruction. However, the undo operation cannot be performed if other instructions are edited or a job is executed in the play mode after editing the move instruction.

- The undo operation works only for the last five edited instructions only.
- 1. Press [ASSIST].
  - The assist menu appears.

- 2. Select {UNDO}.
  - The last operation is undone.
- 3. Select {REDO}.
  - The last UNDO operation is undone.

- 3 Teaching
- 3.4 Modifying Steps

#### 3.4.6 Modifying Reference Point Instructions

3.4.6.1 Deleting Reference Point Instructions

If the manipulator position differs from the cursor position, an error message is displayed. If this occurs, follow either of the procedures below.

- Press [REFP] + [FWD] to move the manipulator to the position to be deleted.
- Press [MODIFY] then [ENTER] to change the reference point position data to the current position of the manipulator.
- 1. Move the cursor to the reference point instruction to be deleted.
- 2. Press [DELETE].
  - The key lamp will blink.
- 3. Press [ENTER].
  - The reference point instruction at the cursor line is deleted.

#### 3.4.6.2 Modifying Reference Point Instructions

- 1. Move the cursor to the reference point instruction to be modified.
- 2. Move the manipulator with the axis operation keys.
  - Turn ON the servo power and use the axis operation keys to move the manipulator to the desired position.
- 3. Press [REFP].
- 4. Press [MODIFY].
  - The key lamp will light.
- 5. Press [ENTER].
  - The reference point instruction at the cursor line is changed.

### Spot and Arc Welding

- 3 Teaching
- Using Motor Gun 3.4 Modifying Steps

#### 3.4.7 Modifying Timer Instructions

#### 3.4.7.1 Deleting Timer Instructions

1. Move the cursor to the timer instruction to be deleted.

- 2. Press [DELETE].
  - The key lamp will light.
- 3. Press [ENTER].
  - The timer instruction at the cursor line is deleted.

0003	MOVJ VJ=50.00
0004	MOVL V=138

#### 3.4.7.2 Modifying Timer Instructions

1. Move the cursor to the timer instruction to be modified.

0003	MOVJ VJ=50.00	
0004	TIMER T=1.00	
0005	MOVL VJ=138	

- 2. Press [SELECT].
- 3. Move the cursor to the input buffer line timer value.
  - Move the cursor to the input buffer line timer value and press
     [SHIFT] + the cursor key to set the data.
  - To use the Numeric keys to input data, move the cursor to the input buffer line timer value and press [SELECT].

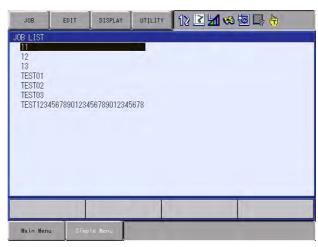

- 4. Change the timer value.
- 5. Press [MODIFY].
- 6. Press [ENTER].
  - This key lamp will light.

- 3 Teaching
- 3.5 Modifying Jobs

### 3.5 Modifying Jobs

#### 3.5.1 Calling Up a Job

- 1. Select {JOB} under the main menu.
- 2. Select {SELECT JOB}.
  - The JOB LIST window appears.

3. Select the desired job.

#### 3.5.2 Windows Related to Job

There are five types of job windows. Jobs can be checked and edited in these windows.

- JOB HEADER Window Comments, data and time of registration, edit prohibit status, and so on are displayed and edited.
- JOB CONTENT Window The content of the registered job can be displayed and edited.
- COMMAND POSITION Window The taught data is displayed.
- JOB LIST Window The registered job is sorted alphabetically, then displayed, and the job is selected.
- JOB CAPACITY Window The number of registered jobs, amount of memory, number of steps used, etc. is shown.

### Spot and Arc Welding Using Motor Gun

- 3 Teaching
- 3.5 Modifying Jobs

#### 3.5.3 JOB HEADER Window

- 1. Select {JOB} under the main menu.
- 2. Select {JOB}.
- 3. Select {DISPLAY} under the menu.
- 4. Select {JOB HEADER}.
  - The JOB HEADER window appears. Scroll the window using the cursor.

	JOB	EDIT	DISPLAY	UTILITY	17 🗹 📶 🤜 🔟 🗆	} ( <del>1</del> )
A	JOB HEADER JOB NAME: COMMENT DATE CAPACITY LINES / SI EDIT LOCK TO SAVE TO GROUP SET JOB KIND	TESTO1 TEPS D FD NC R1	T DONE	YTE		
	Main Menu	u Simp	le Menu			

#### A. JOB NAME

Displays the name of the current job.

#### **B. COMMENT**

Displays the comments attached to the current job. This can be edited in this window.

#### C. DATE

Displays the date and time of the last editing of the job.

#### D. CAPACITY

Displays the amount of memory that is being used to register this job.

#### E. LINES

Displays the total number of instructions registered in this job.

#### F. STEPS

Displays the total number of move instructions registered in this job. **G. EDIT LOCK** 

Displays whether the edit prohibit setting for this job is ON or OFF. This can be changed in this window.

#### H. TO SAVE TO FD

Displays "DONE" if the contents of the job have already been saved to an external memory after the date and time of the last editing operation, and displays "NOT DONE" if they have not been saved. The job is marked as "DONE" only if it is saved as an independent job or as a related job. If it is saved in a CMOS batch operation, it is not marked as "DONE".

#### I. GROUP SET

Displays the control group that this job controls. If the master axis is specified, the master axis is highlighted.

#### J. JOB KIND

SUPPLE-

Displays the kind of this job.

To return to the JOB CONTENT window from the JOB HEADER window, select {DISPLAY} from the menu and then select {JOB CONTENT}.

- 3 Teaching
- 3.5 Modifying Jobs

#### 3.5.4 JOB CONTENT Window

- 1. Select {JOB} under the main menu.
- 2. Select {JOB}.
  - The JOB CONTENT window appears.
  - (Left) : The cursor is moved to the address area.

 $\rightarrow$  (Right): The cursor is moved to the instruction area.

## Spot and Arc Welding Using Motor Gun

- 3 Teaching
- 3.5 Modifying Jobs

#### 3.5.5 COMMAND POSITION Window

- 1. Select {ROBOT} under the main menu.
- 2. Select {COMMAND POSITION}.
  - Edit operations cannot be conducted on this window, but the taught play speed and position data can be viewed on this window.

#### A. Interpolation

Displays the interpolation type.

#### B. Speed

Displays the play speed.

#### **C. Command Position**

Displays the tool file number and position data that has been taught for this job. Steps which have no position data, such as move instructions which use position variables, are marked with an asterisk (\*).

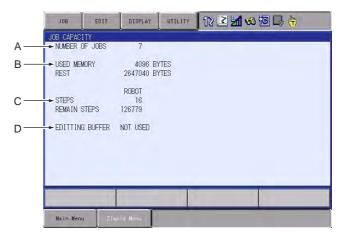

#### **D. Current Data**

Displays the current tool file number and position of the manipulator.

- 3 Teaching
- 3.5 Modifying Jobs

#### 3.5.6 JOB CAPACITY Window

- 1. Select {JOB} under the main menu.
- 2. Select {JOB CAPACITY}.

#### A. NUMBER OF JOBS

Displays the total number of jobs currently registered in the memory of DX100.

#### **B. USED MEMORY**

Displays the total amount of memory used in the DX100.

#### C. STEPS

Displays the total number of used steps.

#### **D. EDITING BUFFER**

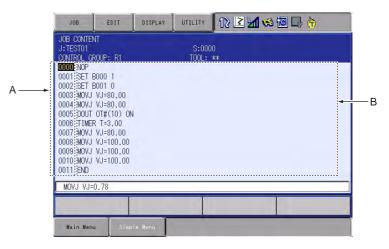

Displays editing buffer use.

## Spot and Arc Welding Using Motor Gun

- 3 Teaching
- 3.6 Editing Instructions

### 3.6 Editing Instructions

The editable content differs depending on whether the cursor is in the address area or instruction area.

#### **A. When the cursor is in the address area** Instructions can be inserted, deleted, or modified.

### B. When the cursor is in the instruction area The data of additional items of already-registered instructions can be modified, inserted, or deleted.

Editing only additional items is called "line editing".

When inserting or modifying instructions, input the instruction with the function keys such as [TIMER], etc. or by using the instruction list dialog box.

The selected instruction is displayed on the input buffer line with the same additional items as registered previously.

If the addition, deletion or modification of additional item is needed, edit on the instruction DETAIL EDIT window. If it is not needed, continue the registration process.

# Spot and Arc Welding Using Motor Gun

3 Teaching

#### 3.6 Editing Instructions

### 3.6.1 Instruction Group

The instructions are divided into eight groups by processing or each work.

Display	Instruction Group	Content	Example
IN/OUT	I/O Instruction	Controls input and output	DOUT, WAIT
CONTROL	Control Instruction	Controls processing and each work	JUMP, TIMER
MOTION	Move Instructions	Moves the manipulator	MOVJ, REFP
DEVICE	Work Instructions	Operates arc welding, spot welding, handling, painting, etc.	ARCON, WVON, SVSPOT, SPYON
ARITH	Operating Instructions	Performs arithmetic calculation	ADD, SET
SHIFT	Shift Instructions	Shifts the teaching point	SFTON, SFTOF
SENS (Option)	Sensor Instructions (Option)	Instructions related to the sensor	COMARCON
OTHER	Other Instructions	Instructions for functions other than above	SHCKSET
SAME	-	Specifies the instruction where the cursor is.	
PRIOR	-	Specifies the previously-registered instruction.	

### Instruction List

By pressing [INFORM LIST]

, the instruction group list dialog box

appears.

# Spot and Arc Welding Using Motor Gun

- 3 Teaching
- 3.8 Test Operations

## 3.8 Test Operations

Playback operations can be simulated in the teach mode with test operations. This function is convenient for checking continuous paths and operation instructions.

Test operation differs in the following ways from actual playback in the play mode.

• Operation speeds greater than the maximum teaching speed are reduced to the maximum teaching speed.

- Only machine lock is available among special operations for playback in the play mode.
- Work instruction output, such as arc output, is not executed.

### 3.8.1 Test Operation Procedures

Test operation is performed by pressing [INTERLOCK] and [TEST START]. For safety purposes, these keys will only function while the keys are held down.

- 1. Select {JOB} under the main menu.
- 2. Press {JOB}.
  - The test operation JOB CONTENT window appears.
- 3. Press [INTERLOCK] + [TEST START].
  - The manipulator starts the test cycle operation.
  - The manipulator moves only while these keys are held down.
     However, after the operation starts, the motion continues even if [INTERLOCK] is released.
  - The manipulator stops immediately when [TEST START] is released.

Always check safety conditions before starting the manipulator in motion.

- 3 Teaching
- 3.9 Other Job-editing Functions

### 3.9 Other Job-editing Functions

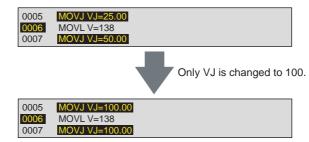

#### 3.9.1 Editing Play Speed

There are two ways to modify play speed:

- Modification of Speed Type
- Relative Modification

#### 3.9.1.1 Modification of Speed Type

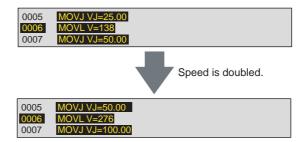

This method is used to modify the speed type (such as VJ, V, VR, etc.)

Type of Play Speed	Explanation			
VJ	Joint Speed	Normal robot axes		
V	TCP Speed			
VR	Posture Angle Speed			
VE	Base Axis Speed			

#### 3.9.1.2 Relative Modification

All steps are selected regardless of the play speed type. This method is used to change all steps by a specified percentage (1% to 200%). This is called relative modification.

The speed of the entire job or specified section can be changed.

- 1. Select {JOB} under the main menu.
- 2. Select {JOB}.
  - The JOB CONTENT window appears.
- 3. Move the cursor to the instruction area.
- 4. Press [SHIFT] + [SELECT] in the speed modify start line.
  - If the section is not specified, the speed of the entire job will be changed.
  - Move the cursor to the end line. The line numbers of the selected lines are highlighted.

Spot and Arc Welding Using Motor Gun

- 3 Teaching
- 3.9 Other Job-editing Functions
- 5. Select {EDIT} under the menu.
- 6. Select {CHANGE SPEED}.
  - The SPEED MODIFICATION window appears.

	JOB	EDIT	DISPLAY	UTILITY	12 🗹 🖬 😣	🔟 📑 🙌
A B C E	SPEED MODI → START LI → END LINE → MODIFICA → SPEED KI → SPEED	NE NO. NO. TION TYPE	0000 0012 NO CONFIEM VJ 25.00 %	1		
	EXECU	ITE	CANCEL			
	Main Menu	Simp	le Menu			

7. Set desired items.

### A. START LINE NO.

Displays the first line number of the section to be modified.

### **B. END LINE NO.**

Displays the last line number of the section to be modified.

### **C. MODIFICATION TYPE**

Selects the confirmation before changing: "CONFIRM" or "NO CON-FIRM".

Each time [SELECT] is pressed when the cursor is on this item, the setting alternates between "CONFIRM" and "NO CONFIRM".

### D. SPEED KIND

Selects the speed type.

When [SELECT] is pressed when the cursor is on this item, selection dialog box appears. Select the speed type to be changed.

### E. SPEED

Specifies the speed value.

When [SELECT] is pressed when the cursor is on this item, the mode changes to the number input mode. Input the speed value and press [ENTER].

- 8. Select "EXECUTE".
  - The speed begins to change.
  - If "MODIFICATION TYPE" is set to "CONFIRM", the confirmation dialog box "Modifying speed" is displayed. Press [ENTER] to change the speed on the first line and search for the next speed. Press the UP/DOWN cursor button to keep the speed on the first line and search for the next speed. To cancel the speed modification, press [CANCEL].
  - If "MODIFICATION TYPE" is set to "NOT CONFIRM", all the speeds of the specified section are changed.

- 3 Teaching
- 3.9 Other Job-editing Functions

#### 3.9.1.3 Modification by TRT (Traverse Time)

Modifications made by TRT have the following characteristics:

- By setting the time required to execute a move instruction (moving time) to a desired value, the speeds can be modified.
- It is possible to measure the moving time without actually moving the manipulator.

For example, when the movement from lines 5 through 20 currently requires 34 seconds, and you want to reduce it to 15 seconds or extend it to 50 seconds, this function is used.

- 1. Select {JOB} under the main menu.
- 2. Select {JOB}.
  - The JOB CONTENT window appears.
- 3. Move the cursor to the instruction area.
- 4. Press [SHIFT] + [SELECT] in the weaving time measure start line.
  - Move the cursor to the end line. The line numbers of the selected lines are highlighted.
- 5. Select {EDIT} under the menu.
- 6. Select {TRT}.

- The TRT window appears.

3 Teaching

NOTE

3.9 Other Job-editing Functions

- 8. Select "EXECUTE".
  - The speed is changed according to the setting.
    - If instructions that include specific speed data such as SPEED or ARCON instructions (including speed data of the welding condition file) exist in the specified section, the speed data for those steps are not changed. Therefore, in such cases, the set time and the actual time required are not same.
    - If the speed data is limited by the maximum value, the following message is displayed.

Limited to maximum speed

- Spot and Arc Welding Using Motor Gun

3.9 Other Job-editing Functions

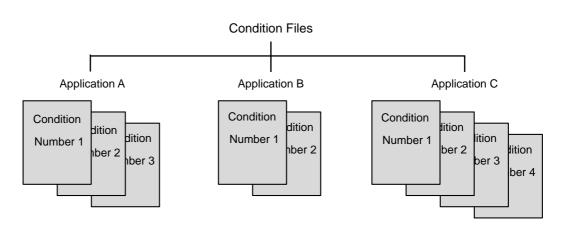

#### 3.9.3 Editing Condition Files

Condition files are prepared in order to set the conditions for the manipulator to execute instructions.

Multiple condition files are provided for each application. More than one pattern can be set up in each condition file. The patterns are listed by "condition numbers". This number is specified by the work instruction in a job.

Refer to *DX100 Operator's Manual* of each application for information regarding the contents and editing methods of the condition file.

- 3 Teaching
- 3.9 Other Job-editing Functions

#### 3.9.4 User Variables

User variables are used for jobs to store counters, calculation results or input signals. Since the same user variable can be used in multiple jobs, save the numerical values as common references for the jobs and the user variables are maintained even when the power is turned OFF.

User variables have the following applications:

- Controlling of the number of workpieces
- Controlling of the number of jobs
- · Sending/receiving of information between jobs

The data formats for user variables are described in the following table:

Data Format	Variable No. (pcs)	Functions	
Byte Type	B000 to B099 (100)	Range of storable values is from 0 to 255. Can store I/O status. Can perform logical operations (AND, OR, etc.)	
Integer Type	1000 to 1099 (100)	Range of storable values is from - 32768 to 32767.	
Double Precision Integer Type	D000 to D099 (100)	Range of storable values is from - 2147483648 to 2147483647.	
Real Type	R000 to R099 (100)	Range of storable values is from - $3.4E+38$ to $3.4E38$ . Accuracy: $1.18E-38 < x \le 3.4E38$	
Character Type	S000 to S099 (100)	Maximum storable number of characters is 16.	
Position Type	P000 to P127 (128)	Can store position data in pulse form or in XYZ form.	
	BP000 to BP127 (128) EX000 to EX127 (128)	XYZ type variable can be used as target position data for move instructions, and as incremental values for parallel shift instructions.	

Table 3-5: User Variables

163543-1CD	
Spot and Arc Welding Using Motor Gun	3 Teaching 3.9 Other Job-editing Functions

	<ul> <li>Play Speed V: MOVL V=1000 The variable 1000 is used for speed V with this move instruction. <u>The unit for V is 0.1mm per second.</u> For example, if 1000 were set as 1000, the following would be true: 1000=1000 → unit for V is 0.1mm/s → V=100.0 mm/s Note that, depending on the unit being used, the value of the variable and the value of the actual speed on occasion might not match.</li> </ul>
NOTE	<ul> <li>Play Speed VJ: MOVL VJ=1000 <u>The unit for VJ is 0.01%.</u> For example, if 1000 were set as 1000, the following would be true: 1000=1000 → unit for VJ is 0.01% → VJ=10.00%.</li> </ul>
	<ul> <li>Timer T: TIMER T=1000 The unit for T is 0.01 seconds. For example, if 1000 were set as 1000, the following would be true: 1000=1000 → unit for T is 0.01 seconds → T=10.00 seconds.</li> </ul>

- (2) Check the selected axis on the status line.
- 3. Press [FWD].
  - Selected axis moves to the position specified by the variable.

The selected axis (manipulator, base, or station) moves directly to the set variable position. Before pressing [FWD], check that the surrounding area is safe.

- 3 Teaching
- 3.9 Other Job-editing Functions

#### 3.9.4.10 Manipulator Types

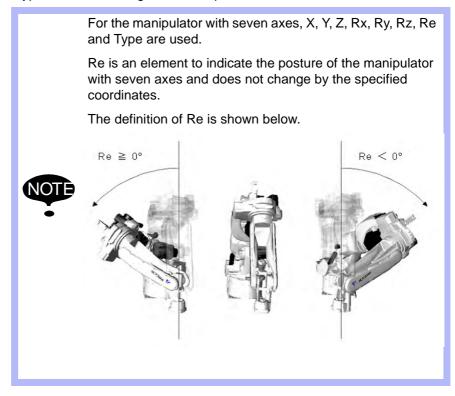

When the position data of the job data are described using the XYZ format, several postures may be taken according to the manipulator's structure when moving it to the described position.

Although these postures have the same coordinates for TCP, they vary in pulse for each axis.

Thus, the manipulator's posture cannot be uniquely defined only by the coordinate value, and it is necessary to specify the data other than the coordinate value to define the manipulator's posture.

This is called "Type".

Type varies according to the manipulator model.

- 3 Teaching
- 3.9 Other Job-editing Functions

#### 3.9.9 Upper Arm/Lower Arm

This specifies a type comprised of L-axis and U-axis when the L-axis and U-axis are viewed from the right-hand side.

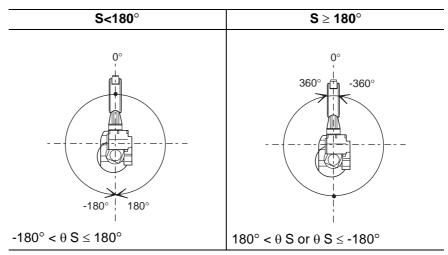

#### 3.9.10 S-axis Angle

This designation is required for the manipulators which have working envelopes greater than  $\pm 180^{\circ}$ .

This specifies whether the S-axis angle is less than  $\pm 180^\circ$  or greater than  $\pm 180^\circ.$ 

### Spot and Arc Welding Using Motor Gun

3 Teaching

3.9 Other Job-editing Functions

#### 3.9.11 Editing Local Variables

As well as user variables, local variables can be used for the storage of counters, calculations, and input signals. The data format is the same as that of user variables. As shown in the following table, the letter L is affixed to the variable number to indicate a local variable.

Table 3-7: Local Variables

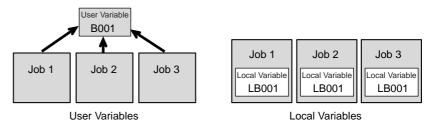

Da	ta Format	Variable No.	Functions
Byte Type		LB000 to LBロロロ	Range of storable values is from 0 to 255. Can store I/O status. Can perform logical opera- tions (AND, OR, etc.)
Integer T	уре	LI000 to	Range of storable values is from -32768 to 32767.
Double Precision Integer Type		LD000 to	Range of storable values is from -2147483648 to 2147483647.
Real Typ	e	LR000 to LRロロロ	Range of storable values is from -3.4E+38 to 3.4E+38 Accuracy: 1.18E-38 < x ≤ 3.4E+38
Characte	er Type	LS000 to LSDDD	Maximum storable number of characters is 16.
Position Type	Robot Axes	LP000 to LP□□□	Can store position data in pulse form or in XYZ form.
	Base Axes	LBP000 to LBP□□□	XYZ type variables can be used as target position data for move instructions, and as
	Station Axes	LEX000 to LEXDDD	incremental values for parallel shift instructions.

Local variables differ from user variables in the following four ways:

#### • Used in One Job Only

With user variables it is possible to define and use one variable in multiple jobs, but local variables are used only in the job in which they are defined, and cannot be read from other jobs.

Accordingly, local variables do not affect other jobs, so it is possible to define a variable number (such as LB001) separately in different jobs, and use it in different ways in each of these jobs.

#### • Able to Use Any Number of Variables

The number is set in the JOB HEADER window. When the number is set, the area for the value is saved in memory.

- 3 Teaching
- 3.9 Other Job-editing Functions

## Not Able to Display the Variable Contents

To display the local variable contents, user variables are needed. For example, to view the contents of local variable LP000, save it temporarily as user variable P001. Then execute the instruction SET P001 LP000, and view the POSITION VARIABLE window for P001.

## Enabled Only During the Execution of the Defined Job

The contents of the local variables are enabled only during the execution of the defined job.

The local variable field is assured when the defined job is called (when the job is executed by a CALL or JUMP instruction, or the job is selected by the menu). Once the job is completed by the execution of a RET, END, or JUMP instruction, the local variable data that was set is disabled. However, if a job which uses local variables itself calls a separate job, then is returned by use of a RET instruction, the data that was present prior to the CALL instruction remains in effect and can be used.

## **Precautions for Variables and Units**

As was the case with user variables, note that, depending on the value of the unit being used, the value of the variable and the value of the actual speed or time an occasion might not match. Refer to *Section 3.9.4 "User Variables" on page 3-74*.

3.9 Other Job-editing Functions

#### 3.9.11.1 Setting the Number of Local Variables

The number of local variables used in a job is set in the JOB HEADER window. When the number of local variables is set, memory is allocated for those variables.

Only when expanding the "INSTRUCTION LEVEL", it is possible to use local variables. Refer to "8.12 Instruction Level Setting" of "DX100 INSTRUCTIONS" (162536-1CD) for details on setting the language level.

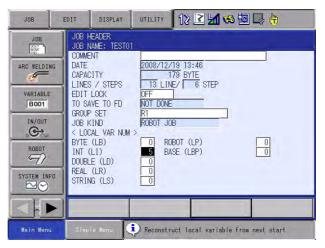

- 1. Select {JOB} under the main menu.
- 2. Select {JOB}.
- 3. Select {DISPLAY} under the menu.
- 4. Select {JOB HEADER}.
  - The JOB HEADER window appears. Scroll the window using the cursor.

- 5. Select the number of local variables to be set.
  - The input buffer line appears.

- 3 Teaching
- 3.9 Other Job-editing Functions
- 6. Input the number of variables.
- 7. Press [ENTER].
  - The number of local variables are set.

#### 3.9.12 Search

When editing or checking, jobs and steps can be searched for. Search can be done when the cursor is in either the address or instruction area on the JOB CONTENT window.

- 1. Select {JOB} under the main menu.
- 2. Select {JOB}.
  - The JOB CONTENT window appears.
- 3. Select {EDIT} under the menu.
  - The pull-down menu appears.

# A. Job Content

The cursor moves according to the playback operation. The contents are automatically scrolled as needed.

# **B. Override Speed Settings**

Displayed when override speed setting is performed.

# C.Cycle Time

Displays the operating time of the manipulator. Each time the manipulator is started, the previous cycle time is reset, and a new measurement begins. Either showing or hiding the cycle time display is selectable.

## D. Start No.

First step in the measurement. Measurement starts when the start button lamp lights and the playback starts.

# E. Motion Time

Displays the weaving time of the manipulator.

## F. Playback Time

Displays the time from the beginning to the end of the measurement. Measurement ends when the manipulator stops and the start button lamp goes off.

## 4.1.2.1 Display of Cycle Time

Follow the procedure below to set whether or not to display the cycle time on the PLAYBACK window.

- 1. Select {DISPLAY} under the menu.
- 2. Select {CYCLE TIME}.
  - The cycle time is displayed.
  - Repeat the same operation to hide the cycle time display.

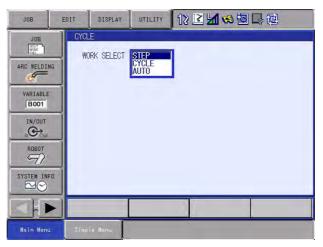

- 4 Playback
- 4.1 Preparation for Playback
- 4.1.2.2 Operation Cycle

There are three types of manipulator operation cycles:

- AUTO : Repeats a job continuously.
- 1 CYCLE : Executes a job once. If there is a called job during execution, it is performed, after which the execution processing returns to the original job.
- 1 STEP : Executes one step (instruction) at a time.

The operation cycle can be changed as follows:

- 1. Select {JOB} under the main menu, and then select {CYCLE}.
- 2. Select the operation cycle to be changed.
  - The operation cycle is changed.

# Spot and Arc Welding Using Motor Gun

4 Playback

4.1 Preparation for Playback

# Automatic Setting for Operation Cycle

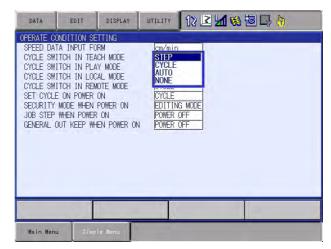

Automatic setting of the operation cycle can be changed by the following operation.

This can be done in the management mode only.

- 1. Select {SETUP} under the main menu.
- 2. Select {OPERATE COND}.
  - The OPERATING CONDITION window appears. Use the cursor to scroll the screen.

4 Playback4.2 Playback

# 4.2 Playback

# 4.2.1 Playback Operation

After checking to be sure there is no one near the manipulator, start the playback operation by following the procedures below.

Playback is the operation by which the taught job is played back. Follow the procedures below to start the playback operation.

- Programming pendant (start button)
- Peripheral device (external start input)

Which is used to start playback is specified by the mode switch on the programming pendant.

Mode Switch on Programming Pendant	Job is started up by
[PLAY]	[START] button on programming pendant
[REMOTE]	Peripheral device

For playback using the programming pendant, follow the procedures below.

# 4.2.1.1 Selecting the Start Device

- 1. Set the mode switch on the programming pendant to "PLAY".
  - The remote mode is disabled and the play mode is enabled so the machines are to be started up by the programming pendant.

## 4.2.1.2 Servo On

- 1. Press [Servo ON Ready].
  - DX100 servo power is ON and the Servo ON lamp on the programming pendant lights.

# 4.2.1.3 Start Operation

- 1. Press [START].
  - The start button lamp lights and the manipulator begins operation.

- 4 Playback
- 4.2 Playback

# 4.2.2 Special Playback Operations

The following special operations can be performed during playback:

- Low speed operation
- Limited speed operation
- Dry run speed operation
- Machine lock operation
- Check mode operation

Two or more special operations can be performed at the same time. If multiple operations are selected, the speed during playback is limited to the speed of the slowest operation. Settings for special operations are done in the SPECIAL PLAY window.

When the PLAYBACK window is displayed, move the cursor to the menu area and select {UTILITY}  $\rightarrow$  {SETUP SPECIAL RUN}. The SPECIAL PLAY window appears.

# 4.2.2.1 Low Speed Operation

The manipulator moves at low speed during the first step after starting.

After the operation of this step, the manipulator stops regardless of the selection of the operation cycle and then low speed operation is canceled.

Even if the manipulator is stopped its motion during the low speed operation, the low speed status would not be canceled before it reaches the first step.

After one step operation, pressing [START] allows the manipulator to move at the taught speed.

- 1. Select "LOW SPEED START" on the SPECIAL PLAY window.
  - The setting alternates between "VALID" and "INVALID".
- 2. Select "COMPLETE".
  - The window returns to the PLAYBACK window.

163543-1CD	
Spot and Arc Welding Using Motor Gun	4 Playback 4.2 Playback
Cong Motor Can	

## 4.2.2.2 Limited Speed Operations

The manipulator operates within the limited speed for the teach mode. Usually, the limited speed is set to 250 mm/s. However, operation is performed at actual playback speeds for steps in which the set speed is under this limit.

- 1. Select "SPEED LIMIT" under the SPECIAL PLAY window.
  - The setting alternates between "VALID" and "INVALID".
- 2. Select "COMPLETE".
  - The window returns to the PLAYBACK window.

#### 4.2.2.3 Dry-run Speed Operations

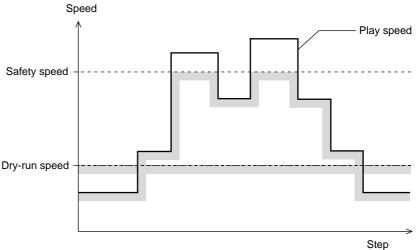

The dry-run speed is a constant speed that is independent of the teaching speeds. The manipulator executes all the steps at a constant speed, which is convenient for quick check of a job consisting of slow operations. The dry-run speed is 10% of maximum speed.

Be careful of steps programmed at lower speeds than the dry-run speed, because they are executed at greater speeds than programmed.

- 1. Select the "DRY-RUN SPEED" under the SPECIAL PLAY window.
  - The setting alternates between "VALID" and "INVALID".
- 2. Select "COMPLETE".
  - The window returns to the PLAYBACK window.

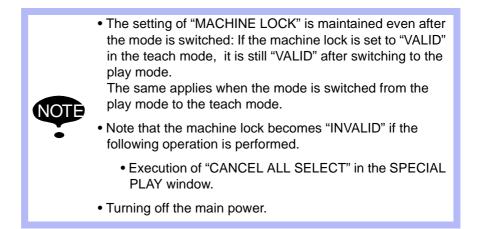

- 4 Playback
- 4.2 Playback

## 4.2.2.4 Machine Lock Operation

A job is played back without moving the manipulator to check the status of input and output.

- 1. Select "MACHINE LOCK" under the SPECIAL PLAY window.
  - The setting alternates between "VALID" and "INVALID".
- 2. Select "COMPLETE".
  - The window returns to the PLAYBACK window.

## 4.2.2.5 Check Mode Operation

The machine runs without issuing work instructions, such as the ARCON instruction. It is used primarily to check the path of the program.

- 1. Select "CHECK-RUN" under the SPECIAL PLAY window.
  - The setting alternates between "VALID" and "INVALID".
- 2. Select "COMPLETE".
  - The window returns to the PLAYBACK window.

## 4.2.2.6 Weaving Prohibit Setting during Check Mode Operation

The weaving operation is not executed in the weaving section of the job.

- 1. Select "WEAV PROHIBIT IN CHK-RUN" under the SPECIAL PLAY window.
  - The setting alternates between "VALID" and "INVALID".
- 2. Select "COMPLETE".
  - The window returns to the PLAYBACK window.

- 4.3 Stop and Restart

# 4.3 Stop and Restart

The manipulator stops in the following conditions:

- Hold
- Emergency stop
- Stop by alarm
- Others

# 4.3.1 Hold

Hold operation causes the manipulator to stop all motion.

SUPPLE [HOLD] lamp lights while it is held down. At the same time, [START] lamp goes OFF.

### 4.3.1.1 Using the Programming Pendant

### Hold

- 1. Press [HOLD] on the programming pendant.
- 2. The manipulator stops. The [HOLD] lamp lights while the [HOLD] button is held down.

# Release

- 1. Press [START] on the programming pendant.
- 2. The manipulator restarts its operation from the position where it was stopped.
- 4.3.1.2 Using an External Input Signal (System Input)
  - Hold
    - 1. Turn ON the hold signal from an external input (system input).
      - The manipulator stops temporarily.

- The output signal "HOLD" turns ON.
- The programming pendant [HOLD] lamp lights.

## Release

- 1. Turn off the hold signal from an external input (system input).
  - Hold is released.
  - To continue the operation, press [START] or turn ON the external input signal (system input). The manipulator restarts its operation, beginning from the position where it was stopped.

# Spot and Arc Welding Using Motor Gun

- 4 Playback
- 4.3 Stop and Restart

# 4.3.2 Emergency Stop

At an emergency stop, the servo power supply that drives the manipulator is turned OFF and the manipulator stops immediately. An emergency stop can be performed by using either of the following:

- Button on the Front Door of the DX100
- Programming pendant
- External input signal (system input)

# Emergency Stop

- 1. Press the emergency stop button
  - The servo power turns OFF and the manipulator stops immediately.
  - On the front door of the DX100:

– On the programming pendant:

Using the Emergency Stop Button on the Programming Pendant

Robot stops by P.P. emergency stop

Using the External Input Signal (System Input)

Robot stops by external emergency stop

# Release

1. Turn the emergency stop button () in the direction of the arrows.

- 4.3 Stop and Restart

4.3.2.1 Restart After Emergency Stop

- Prior to restarting after an emergency stop, confirm the position for the next operation and make sure there is no interference with the workpiece or fixture.
- The application of an emergency stop during high speed operations on continuous steps can result in the manipulator stopping two or three steps prior to the step that is being displayed. There is a risk of interference with the workpiece or fixture when the manipulator is restarted under such conditions.

# Spot and Arc Welding Using Motor Gun

- 4 Playback
- 4.3 Stop and Restart

# 4.3.3 Stop by Alarm

If an alarm occurs during operation, the manipulator stops immediately and the ALARM window appears on the programming pendant indicating that the machine was stopped by an alarm.

 If more than one alarm occurs simultaneously, all alarms can be viewed on the window. Scroll down the viewing area of the window when necessary.

DATA	EDIT	DISPLAY	UTILITY	12 🗳 🖬 🗸	s 🔞 🔘 (†)

				RESET	
Main Men	u Síme	le Menu			

The following operations are available in the alarm status: window change, mode change, alarm reset, and emergency stop. To display the ALARM window again when the window is changed during alarm occurrence, select {SYSTEM INFO} and then {ALARM HISTORY}.

# Releasing Alarms

<Minor Alarms>

- 1. Press [SELECT].
  - Select "RESET" under the ALARM window to release the alarm status.
  - When using an external input signal (system input), turn ON the "ALARM RESET" setting.

<Major Alarms>

- 1. Turn OFF the main power supply and remove the cause of the alarm.
  - If a severe alarm such as hardware failure alarm occurs, the servo power is automatically shut off and the manipulator stops. If releasing does not work, turn OFF the main power and correct the cause of the alarm.

- 4 Playback
- 4.3 Stop and Restart

## 4.3.4 Others

4.3.4.1 Temporary Stop by Mode Change

When the play mode is switched to the teach mode during playback, the manipulator stops immediately.

To restart the operation, return to the play mode and perform a start operation.

4.3.4.2 Temporary Stop by the PAUSE Instruction

When the PAUSE instruction is executed, the manipulator stops operating.

To restart the operation, perform a start operation. The manipulator restarts from the next instruction.

# Spot and Arc Welding Using Motor Gun

- 4 Playback
- 4.4 Modifying Play Speed

# 4.4 Modifying Play Speed

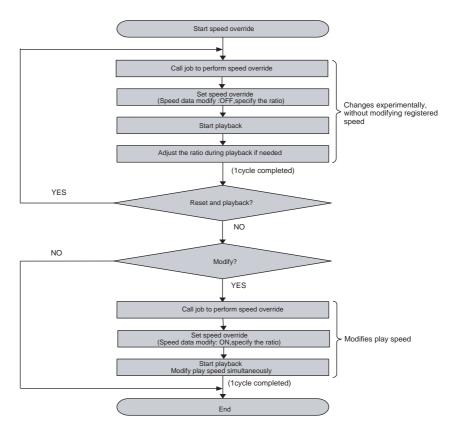

# 4.4.1 Speed Override

Speed modifications using the speed override have the following features:

- Speed can be modified during playback. The job can be played back at various speeds until the play speed is properly adjusted.
- Speed can be increased or decreased by a ratio of the current play speed.

The ratio settings range from 10% to 150% in increments of 1%. Therefore, it is convenient when, for example, all play speed settings are to be increased by 150% at the same time.

The operation flow is shown below.

- 4 Playback
- 4.4 Modifying Play Speed

### 4.4.1.1 Setting Speed Overrides

- 1. Select {UTILITY} under the menu in the PLAYBACK window.
- 2. Select {SPEED OVERRIDE}.
  - The PLAYBACK window shows the speed override status.

JOB	EDIT	DISPLAY	UTILITY	12 🗹 🖬 端 🗟 📑 🗟
PLAYBACK J:TEST01 CONTROL GR	:0UP: R1		S:000 TOOL:	
0000 NOP 0001 MOVJ 0002 MOVL 0003 MOVJ 0004 MOVJ 0005 MOVJ 0006 MOVJ 0006 MOVJ 0007 END	V=1500 VJ=100.00 V=1500 VJ=100.00			
SPEED ADJ	USTMENT MO	DIFY OFF	RATIO <u>100</u>	%

- 3. Select "ON" or "OFF".
  - Each time [SELECT] is pressed, "ON" and "OFF" alternate.
  - Select "ON" to modify the registered play speed during playback.
  - When "OFF" is selected, the registered play speed is not modified. To change the play speed temporarily (for example, to experiment with various speeds), select "OFF".

SPEED ADJUSTMENT MODIFY OFF RATIO 100 %

4. Line up the cursor with the override ratio and move the cursor up and down to change the ratio.

If you want to input the ratio number directly, move the cursor to the override ratio and press [SELECT].

 The number input line appears. Input the override ratio using the Numeric keys.

SPEED ADJUSTMENT MODIFY OFF RATIO

# Spot and Arc Welding Using Motor Gun

4 Playback

NOTE

- 4.4 Modifying Play Speed
- 4.4.1.2 Modifying Play Speed
  - 1. Set speed override.
  - 2. Playback the manipulator.
    - The play speed is increased or decreased in the set ratio.
    - When setting "MODIFY" to "ON", the step's play speed is modified when each step is reached.
    - When one cycle is completed by the END instruction, the speed override setting is cancelled.
      - Assuming that the manipulator moves from step 1 to step 2, the play speed of step 2 is not modified if the speed override is cancelled before reaching step 2.
      - The play speed after the modification by the speed override is limited by the maximum and the minimum speed of manipulator.
      - When the safety speed operation is commanded with the setting of "MODIFY: ON", the manipulator operates at the safety speed. However, the play speed in memory is modified as set by the speed override.
        - Play speed set by the SPEED instruction is not modified.

# 4.4.1.3 Cancelling Speed Override Settings

- 1. Select {UTILITY} under the menu in the PLAYBACK window.
- 2. Select {SPEED OVERRIDE}.
  - The setting of the speed override ratio is cancelled.
  - If cancelled, the speed ratio setting is not displayed on the PLAYBACK window.

The speed override settings are automatically cancelled in the following cases:

• When dry-run speed operation is set.

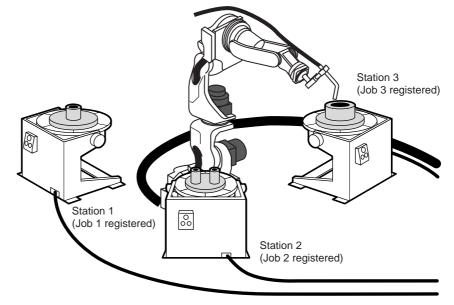

- When the mode is changed to any mode other than the play mode.
- When an alarm or error occurs.
- When one cycle operation is completed with the END instruction.
- When the power supply is turned OFF.

- 4 Playback
- 4.5 Playback with Reserved Start

# 4.5 Playback with Reserved Start

### 4.5.1 Preparation for Reserved Start

In the reserved start function, jobs registered at different stations are played back in the reserved order using the start buttons on the stations.

For example, in the case where three stations handle three different workpieces, as shown in the illustration above, the jobs would be registered as follows:

- Job 1 is registered to process workpiece 1 at Station 1
- Job 2 is registered to process workpiece 2 at Station 2
- Job 3 is registered to process workpiece 3 at Station 3

To play back the jobs, prepare workpiece 1 and press the start button on Station 1. The manipulator executes Job 1. Prepare workpieces 2 and 3 while Job 1 is being executed, and press the start buttons on Stations 2 and 3. Even if Job 1 is being executed at that time, jobs on different stations are reserved in the order that the start buttons have been pressed, and will be executed in that order.

During playback, the status of the reservation can be checked on the start reservation window.

#### 4.5.1.1 Enabling Reserved Start

The start button on the station is operative when the reserved start function is enabled, and the following start operations are disabled.

• [START] on the programming pendant

RE-CSO-A044

# Spot and Arc Welding Using Motor Gun

4 Playback

4.5 Playback with Reserved Start

• Start operation from external input signal (system input)

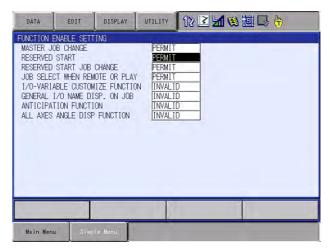

The OPERATING CONDITION window is shown only when the security mode is management mode.

- 1. Select {SETUP} under the main menu.
- 2. Select {OPERATE COND}.
  - The OPERATING CONDITION window appears.
  - The screen is scrolled up/down by the cursor key when it locates at the top/bottom of the items.

# 5 Editing Jobs

This section explains how to manage the jobs without moving the manipulator. Copying, deleting, and modifying of the jobs can be done only in the teach mode. Other operations can be done in any mode.

SUPPLE-MENT Refer to Section 1.2.6 "Character Input Operation" on page 1-18 for the character input operation.

- 5 Editing Jobs
- 5.1 Copying Jobs

# 5.1 Copying Jobs

This operation is used to copy registered jobs and use them to create new jobs. It can be done using either the JOB CONTENT window or the JOB LIST window.

5.1.0.1 Copying Jobs on the JOB CONTENT Window

On the JOB CONTENT window, the current edit job becomes the copy source job.

- 1. Select {JOB} under the main menu.
- 2. Select {JOB}.
  - The JOB CONTENT window appears.

JOB	EDIT	DISPLAY	UTILITY	12 🗹 📶 🍩 🛅 🕞 🎁

Main Menu	Simple Menu

- 2. Select the job to be written to by [SHIFT] + [SELECT].
  - "●" appears on the left of the selected job.

# Spot and Arc Welding Using Motor Gun

- 6 Convenient Functions
- 6.2 Job Edit Function During Playback
- 3. Select {WRITING} under the pull-down menu {JOB}.
  - If the job to be written to is listed in JOB LIST, a confirmation dialog "Overwrite?" appears. Select "YES" to reflect the edited data. If "NO" is selected, the edited data will not be reflected. To cancel writing, press [CANCEL] while the confirmation dialog appears. If the job with the same name is not listed in "JOB LIST", the job to be written to will be added to "JOB LIST". Refer to the "SUPPLEMENT" below.

If data is reflected during playback, the message "Requesting playback edit JOB writing" appears, and the status becomes a write request. To write the job, execute the instruction "LATESTJOB" in the write request status or end playback. If data is reflected in the play mode but not during playback, the job will be written immediately.

However, if the job to be written to is being executed (including jobs in the call stack),

"Error 5240: Cannot write in the JOB in execution." appears, and the edited data will not be reflected.

If a job in the call stack is written to in the play mode but not during playback,

"Error 5241: Cannot write in the JOB in JOB STACK." appears, and the edited data will not be reflected.

If data is reflected during teaching, the job will be written immediately.

# Spot and Arc Welding Using Motor Gun

6 Convenient Functions6.2 Job Edit Function During Playback

• When the mode switch is changed to the teach mode during job editing

Even if the mode switch is changed to the teach mode without reflecting or canceling the edited data, the changed data will be saved. In this case, select the main menu {JOB}, then select the submenu {SELECT JOB} or {PLAY EDIT JOB LIST} to edit data in the same manner as in the play mode. However, position teaching cannot be done.

Regarding the job edited in the play mode, even after the mode is changed to the teach mode, the edited data will not be reflected if {WRITING} is not done.

Writing a job

{WRITING} operates differently depending on the status of the robot.

Select {JOB}, then select {WRITING} to reflect the edited data in the job. The data is reflected as described below depending on whether the job is being executed or not.

- 1. When the job is NOT being executed: The data is reflected immediately.
- 2. When the job is being executed: The data is reflected when the instruction "LATESTJOB" is executed or when the job execution is completed.

"Requesting playback edit JOB writing" appears while waiting for reflect operation (during a write request).

- The executing job cannot be written to even by the instruction "LATESTJOB".
- If a power failure occurs during a write request, the write request will be canceled upon restarting, and the job will not be reflected.
- During a file transfer

{WRITING} cannot be done during file transfer (i.e. external memory operation or data transmission).

In addition, a file cannot be transferred during a write request.

• During a write request

Editing is inhibited during a write request (while "Requesting playback edit JOB writing" appears).

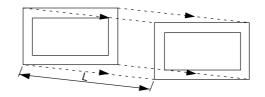

To edit data, wait for the writing to be completed or cancel the write request.

- 6 Convenient Functions
- 6.3 Parallel Shift Function

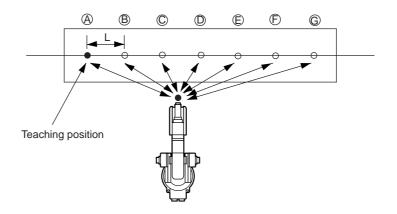

# 6.3 Parallel Shift Function

## 6.3.1 Function Overview

Parallel shift refers to the shifting of an object from a fixed position in such a way that all points within the object move an equal distance. In the model for parallel shift shown in the following, the shift value can be defined as the distance L (three-dimensional coordinate displacement). The parallel shift function is relevant to the actual operation of the manipulator because it can be used to reduce the amount of work involved in teaching by shifting a taught path (or position).

In the example in the figure below, the taught position A is shifted in increments of the distance L (this is actually a three-dimensional XYZ displacement that can be recognized by the robot) in order to enable the operation that was taught at position A to also be performed at positions B through G.

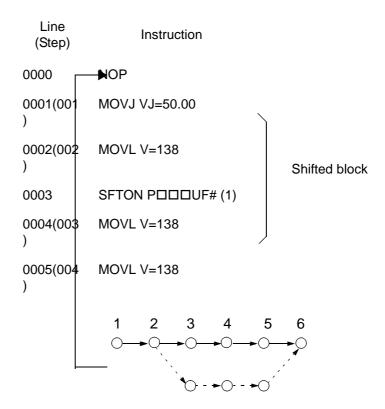

Spot and Arc Welding
Using Motor Gun

6 Convenient Functions6.3 Parallel Shift Function

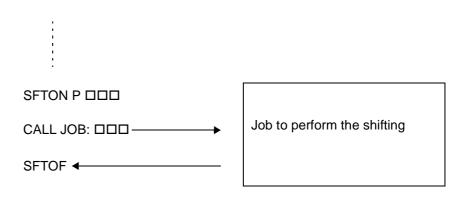

6.3.1.1 Parallel Shift of Step

The block from the SFTON to the SFTOF instructions is subject to the shift operation.

6.3.1.2 Parallel Shift of Job

When shifting an entire series of operations, the range to be shifted by the shift instruction can be set using the method indicated above, but the method shown in the following, in which just the part to be shifted is made into a separate job, can also be used.

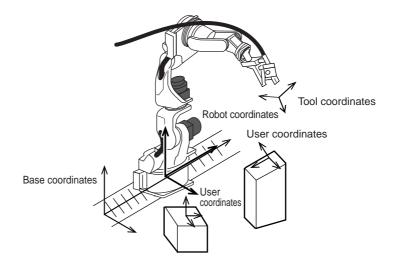

Spot and Arc Welding Using Motor Gun

- 6 Convenient Functions
- 6.3 Parallel Shift Function

# 6.3.2 Setting the Shift Value

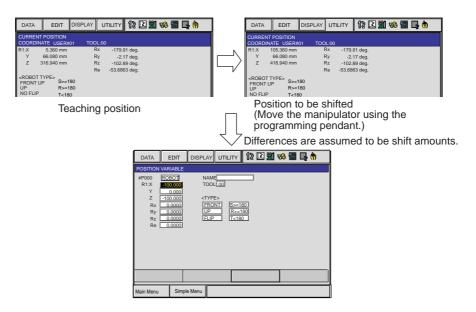

### 6.3.2.1 Coordinate Systems

The shift value for parallel shift is X, Y, and Z increment in each coordinates. There are four coordinates: base coordinates, robot coordinates, tool coordinates, and user coordinates. In systems with no servo track, the base coordinates and robot coordinates are the same.

### 6.3.2.2 Setting the Shift Value

When setting the shift value for the position variables, use the current position (coordinates) of the manipulator in the window.

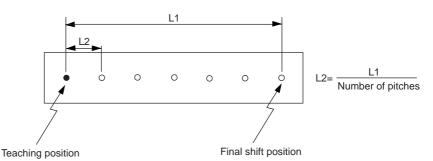

The shift value is the X, Y, and Z difference between the shift position and teaching position and the difference in angular displacement RX, RY, and RZ (normally set at "0"). If shifting is executed at equal pitch intervals, for example for palletizing, find the difference between the teaching position

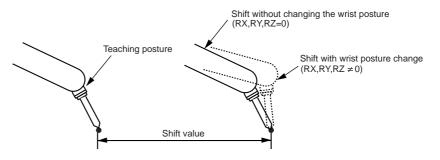

Spot and Arc Welding Using Motor Gun

6 Convenient Functions6.3 Parallel Shift Function

and the final shift position, then divide by the number of pitch intervals (number of divisions) to calculate the shift value per pitch.

The posture of the wrist is defined by the angular displacement of the coordinates of the wrist axes. Consequently, if the shift value is specified with X, Y, and Z only (RX, RY, RZ=0), the wrist is shifted while maintaining the same posture as at the teaching point. Since shifting is normally performed without changing the posture, there is no need to specify an angular displacement for the wrist. The motion when a parallel shift is performed is shown in the following:

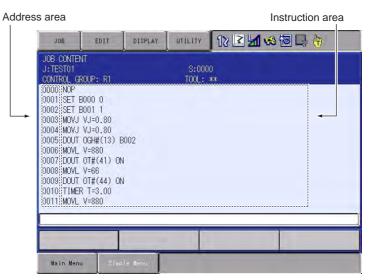

The shift value is calculated on the position data window for the coordinates in which the shift is performed. Since this is normally performed in the user coordinates, the position data window for the user coordinates is used.

### 6.3.3.3 MSHIFT Instruction

When a parallel shift of the wrist posture is attempted, the manipulator may not be shifted to the target posture in the following cases.

- Posture displacement (Rx, Ry, Rz) is specified to the shift value set by the user.
- When a displacement between two points is calculated using an INFORM operating instruction (ADD instruction, SUB instruction, etc.), and a posture displacement (Rx, Ry, Rz) is specified in the shift value.

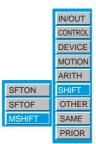

In such cases, the MSHIFT instruction can be used to automatically calculate the optimum shift value for an operation to reach the target shift position and posture. With an MSHIFT instruction, the shift value between the reference position and the target position (shift position) when the parallel shift is performed is determined in the specified coordinate system, and set as the specified position variable.

1. Move the cursor to the line immediately before where the MSHIFT instruction is to be registered.

Line immediately	0005	MOVJ V=138

# 6.3.4 Continuation of the Parallel Shift Function

- If the shift function is cancelled through a job editing operation after the execution of a parallel shift instruction, the job must be started again from the beginning.
- Because no shift is performed when the operation is restarted, there is a possibility of interference between the workpiece and fixture.

If any of the following operations are performed after executing a parallel shift instruction, the shift function is cancelled.

- Job editing operation (changing, deleting, adding)
- Job copy, job name change
- Registering a new job, deleting a job, or modifying a selected job
- Restart after the alarm occurs
- When control power is turned OFF

With any operation other than those listed above, the parallel shift function remains in effect.

6.4 Parallel Shift Job Conversion Function

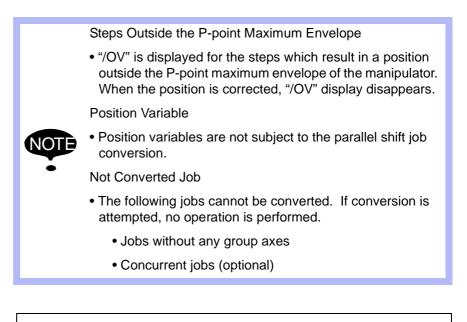

# 6.4 Parallel Shift Job Conversion Function

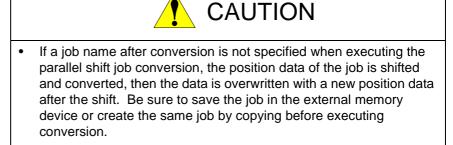

## 6.4.1 Function Overview

If the manipulator and base positions are moved after a job has been taught, the entire job has to be modified. The parallel shift conversion function shortens the modification time required in cases like this by shifting all steps of the job by the same value to create a new job.

When the parallel shift conversion is performed, all job steps are shifted by the same value.

- 6 Convenient Functions
- 6.4 Parallel Shift Job Conversion Function

## 6.4.2 Coordinate Systems for Conversion

When performing the parallel shift job conversion, it is necessary to specify the coordinate systems in which the conversion is to be performed. The coordinate system can be selected from the following:

- Base coordinates
- Robot coordinates
- Tool coordinates
- User coordinates (64 types)
- Master tool coordinates (R\*+R\* job)
- Pulse coordinates

In the case of an ordinary job for which group axes are registered, shift conversion is performed in accordance with the selected coordinate system. The relationship between group combinations and coordinates are shown in the following table.

1 to 4 in the table are followed by their explanations.

Table 6-2: Relationship Between Group Combinations and Coordinates at
Conversion

Group	Explanation
Combination in Job	Usable Coordinate System
R	Shift is performed on the basis of selected coordinates.
	Base coordinates, robot coordinates, tool coordinates, user coordinates, pulse coordinates
R(B)	Shift is performed on the basis of selected coordinates.
	1. Base CoordinatesThe base axis is shifted by the specified amount and the TCP of the manipulator is shifted by the specified amount in the base coordinates.
	2. Robot Coordinates The base axis is shifted by the specified amount. The TCP of the manipulator is shifted by the specified amount in the robot coordinates. These shifts are carried out independently.
	3. Tool CoordinatesThe base axis is shifted by the specified amount. The TCP of the manipulator is shifted by the specified amount in the tool coordinates. These shifts are carried out independently.
	4. User Coordinates The base axis is shifted by the specified amount and the TCP of the manipulator is shifted by the specified amount in the user coordinates.
	5. Pulse The taught position of each axis is shifted by the specified amount on the basis of pulse values.
S	Shift is performed on the basis of pulse values regardless of the coordinates.

## A. SOURCE JOB

Selects the job before conversion. The job which is shown in the JOB CONTENT window is set initially. To change the job, perform the following procedure.

Move the cursor to the job name and press [SELECT]. The JOB LIST window appears. Select the desired job.

### **B. STEP SECTION (Start Step \rightarrow End Step)**

Specifies the step section of the source job. All the steps are set initially. If there is no step in the source job, "\*\*\*" is displayed. To change the section, perform the following procedure.

Move the cursor to the step section indication and press [SELECT]. The input buffer line appears. Input the step number and press [ENTER].

#### **C. DESTINATION JOB**

Specifies the converted job. If this is not specified ( "\*\*\*\*\*\*\*" is displayed), the source job is overwritten with a job after conversion. If the converted job is specified, the source job is copied and converted. To change the job, perform the following procedure.

Move the cursor to the converted job name indication and press [SELECT]. The character input line appears. The source job name is displayed in the input line. To enter a job name without using the source job name, press [CANCEL] and then input a job name.

## **D. COORDINATES**

Selects the conversion coordinates. Move the cursor to the coordinates name and press [SELECT]. The selection dialog box appears. Select the desired coordinates.

When the user coordinates are selected, the input buffer line appears. Input the desired user coordinate number and press [ENTER].

## **E. BASE POINT**

Calculates the difference by the two teaching points as a shift value.

	E	XECUTE	CANCEL				
Main Menu	Simp	le Henu					

# A. FILE NO.

Specifies position variables.

# **B. SHIFT JOB NAME**

The job which was shown in the JOB CONTENT window is set initially. To change the job, perform the following procedure.

Move the cursor to the conversion job name and press [SELECT]. The JOB LIST window appears. Move the cursor to the desired job and press [SELECT]. The PARALLEL SHIFT JOB window reappears, and the job name which was selected is shown.

# C. MODE

Specifies the conversion mode.

# SINGLE (INDEPENDENT JOB CONVERSION)

Only the selected job is converted even if the selected job includes the jobs called by JUMP or CALL instructions. Related jobs are not converted.

# **RELATIVE (RELATIVE JOB CONVERSION)**

Both the selected job and all the related jobs (the jobs called by JUMP or CALL instructions) are converted.

For details of each conversion mode, refer to Section 6.4.4.2" Jobs Targeted for Conversion".

- 6 Convenient Functions
- 6.4 Parallel Shift Job Conversion Function

### **D. COORDINATES**

Selects the conversion coordinates.

Move the cursor to the coordinates name and press [SELECT]. The selection dialog box appears. Select the desired coordinates. When the user coordinates are selected, the input buffer line appears. Input the desired user coordinate number and press [ENTER].

### E. CONV. METHOD

Specifies the conversion methods of related jobs such as a coordinated job with two manipulators or the system with multiple stations.

#### **COMMON (COMMON SHIFT)**

All the manipulators (or all the bases, or all the stations) are converted by the same shift value.

#### **EACH (INDIVIDUAL SHIFT)**

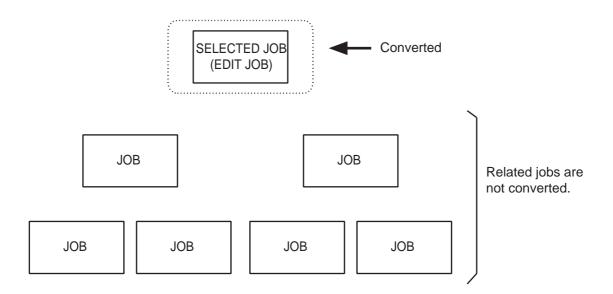

Each manipulator (or each base, or each station) is converted separately by different shift values.

For details of each conversion method, refer to Section 6.4.4.3 "Conversion of Coordinated Jobs" on page 6-40.

#### 6.4.4.2 Jobs Targeted for Conversion

There are two ways to specify the job to be converted as described in the following:

Independent Job Conversion
 Only the selected job is converted even if the selected job includes
 the jobs called by JUMP or CALL instructions. Related jobs are not
 converted.

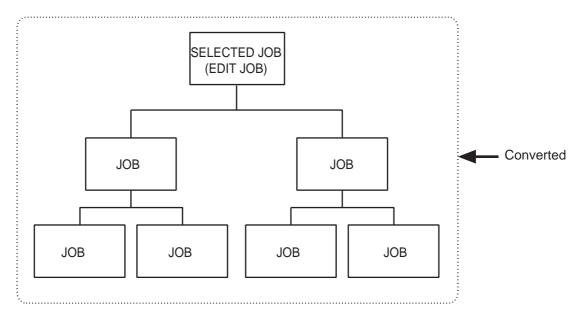

Spot and Arc Welding

# Using Motor Gun

6 Convenient Functions

6.4 Parallel Shift Job Conversion Function

• Related Job Conversion Both the selected job and all the related jobs (the jobs called by JUMP or CALL instructions) are converted.

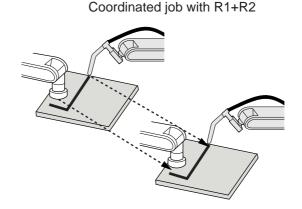

### 6.4.4.3 Conversion of Coordinated Jobs

There are two ways to convert a related job such as a coordinated job with two manipulators or the system with multiple stations as described in the following:

## Common Shift

All the manipulators (or all the bases, or all the stations) are converted by the same shift value.

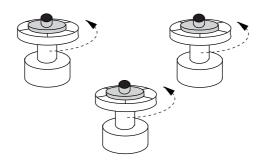

# Spot and Arc Welding Using Motor Gun

6 Convenient Functions

6.4 Parallel Shift Job Conversion Function

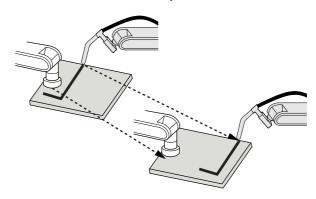

The system with multiple stations

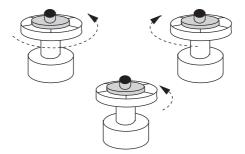

## Individual Shift

Each manipulator (or each base, or each station) is converted separately by different shift values.

Coordinated job with R1+R2

The system with multiple stations

Spot and Arc Welding Using Motor Gun

6 Convenient Functions

6.4 Parallel Shift Job Conversion Function

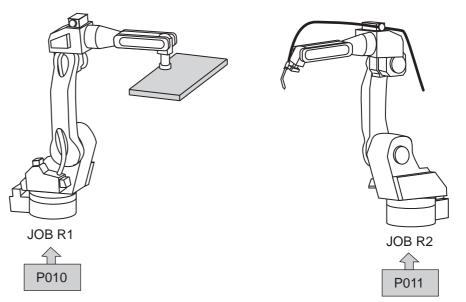

# Variables used in an individual shift

Be sure to use the variables of which numbers are consecutive after the selected number. The variables of which numbers are not consecutive are unable to be selected.

Example 1) When selecting P010 for a coordinated job with R1 + R2: Use P010 for R1.

Use P011 for R2.

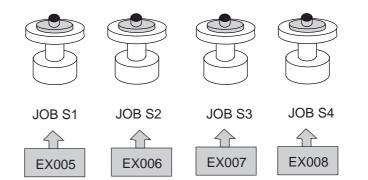

Example 2) When selecting EX005 for multiple jobs with four stations:

Use EX005 for S1.

Use EX006 for S2.

Use EX007 for S3.

Use EX008 for S4.

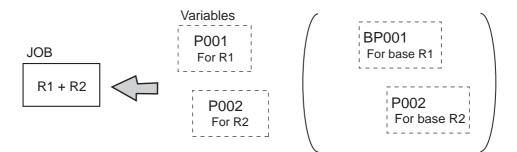

# Spot and Arc Welding Using Motor Gun

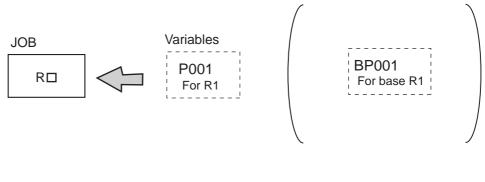

- 6 Convenient Functions
- 6.4 Parallel Shift Job Conversion Function
- Relation between variables and jobs for conversion in an individual shift

### ■ In the case of independent job conversion:

• Coordinated job with R1 + R2 Different shift values can be set for each manipulator and base.

Job with R□ (+ S□)
 Use one variable for a job with one manipulator.

### In the case of related job conversion:

 Different shift values can be set for each manipulator, base, and station.

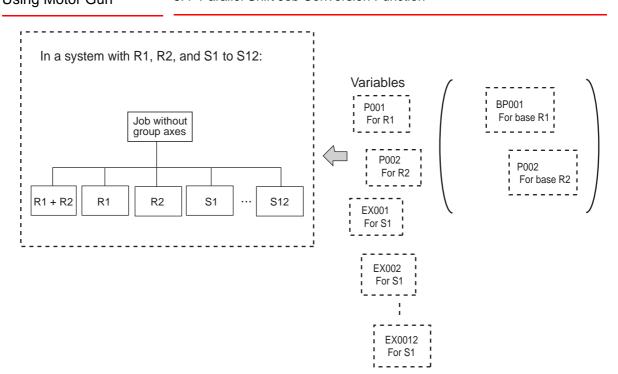

#### 6.4.4.4 Operation Procedure

The following is the operation procedure for the parallel shift job conversion using position variables.

- 1. Set the parameter.
  - Set the parameter S2C652 (SHIFT VALUE FOR PARALLEL SHIFT JOB CONVERSION) to 1 (Position variable shift value).
- 2. Set the position variable.
  - Specify a position variable in advance when setting a shift value by position variables.
  - For the setting of position variables, refer to Section 3.9.4 "User Variables" on page 3-74.
- 3. Select {JOB} under the main menu.

- 7. Specify the conversion items.
  - Specify each item.
- 8. Select "EXECUTE".
  - Select "EXECUTE" then the parallel shift job conversion is executed. The JOB CONTENT window appears when the conversion is completed.
  - When "CANCEL" is selected, the display goes back to the JOB CONTENT window without executing conversion.

F

 If an alarm occurs during conversion, conversion is suspended.

Specify the position variable in advance when using the setting value as a shift value.

# Spot and Arc Welding Using Motor Gun

- 6 Convenient Functions
- 6.5 PAM Function

# 6.5 PAM Function

# 6.5.1 Function Overview

The function for position adjustment during playback (PAM: Position Adjustment by Manual) allows position adjustment by simple operations while observing the motion of the manipulator and without stopping the manipulator. Positions can be adjusted in both teach mode and play mode.

The following data can be adjusted by key input from the programming pendant.

- Teaching Point (Position)
- Teaching Point (Posture angle)
- Operation Speed
- Position Level

SUPPLE-

# 6.5.1.1 Input Ranges for Adjustment Data

The input ranges for adjustment data are indicated in the following table.

Data	Input Range
Number of Steps for Adjustment	Up to 10 steps can be adjusted at the same time.
Position Adjustment Range (X, Y, Z)	Unit: mm, valid to two decimal places, maximum ±10 mm
Posture Angle Adjustment Range (Rx, Ry, Rz)	Unit: deg, valid to two decimal places, maximum ±10 deg
Speed Adjustment Range (V)	Unit: %, valid to two decimal places, maximum ±50%
PL Adjustment Range	0 to 8
Adjustment Coordinates	Robot coordinates, base coordinates, tool coordinates, user coordinates (Default coordinates: robot coordinates)

The input ranges for adjustment data can be changed by the following parameters:

- S3C1098: Position adjustment range (unit: 0.001 mm)
- S3C1099: Speed adjustment range (unit: 0.01%)
- S3C1100: Adjustment coordinate specification
- S3C1102: Posture angle adjustment range (unit: 0.01 deg)

For details, refer to Chapter 8 Parameter on page 8-1.

6 Convenient Functions6.5 PAM Function

NOT

- Base axis and station axis data cannot be adjusted.
  - Adjustment when a TCP instruction is executed is performed by adjusting the data of the selected tool.
- When the coordinates for adjustment are user coordinates, an error occurs if teaching has not been performed in the user coordinates.
  - If an attempt is made to adjust "PL" when there is no "PL" in the step subject to the adjustment, an error occurs.
  - Position variable and reference point steps cannot be adjusted. An error occurs if adjustment is attempted.
  - An attempt to adjust the speed at the step that has no speed tag causes an error.

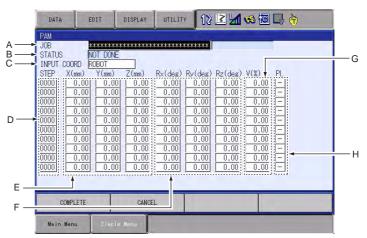

# Spot and Arc Welding Using Motor Gun

6 Convenient Functions

6.5 PAM Function

# 6.5.2 Operating Methods

- 6.5.2.1 Setting Adjustment Data
  - 1. Select {JOB} under the main menu.
  - 2. Select {JOB}.
    - The JOB CONTENT window (in the teach mode) or the PLAYBACK window (in the playback mode) appears.
  - 3. Select {UTILITY} under the pull-down menu.
  - 4. Select {PAM}.
    - The PAM window appears.

- 5. Set adjustment data.
  - Set adjustment data.
  - A. Job

Set the job name to be adjusted.

Line up the cursor and press [SELECT] to display the JOB LIST window.

Move the cursor to the desired job and press [SELECT] to set the adjusted job.

– B. Status

Shows the status of adjustment in the PAM function. "NOT DONE" appears when adjustment is not executed. "DONE" appears when the execution of adjustment is completed.

# - C. Input Coord

Set the desired coordinates. Line up the cursor and press [SELECT] to display the selection dialog box. Move the cursor to the desired coordinate system and press [SELECT] to set the input coordinates.

- D. Step Number

Set the step number to be adjusted. Line up the cursor and press [SELECT] to display the number input buffer line. Input the step number and press [ENTER] to set the value.

- 6 Convenient Functions
- 6.5 PAM Function

# - E. XYZ Coordinate Adjustment

Set the direction and amount of the X, Y, and Z coordinates. Line up the cursor with the data to be adjusted and press [SELECT] to display the number input buffer line.

Input the number data and press  $\left[ \text{ENTER} \right]$  to set the adjusted data.

# - F. Rx, Ry, Rz Coordinate Adjustment

Set the direction and amount of the Rx, Ry and Rz posture angles.

Line up the cursor with the data to be adjusted and press [SELECT] to display the number input buffer line.

Input the number data and press [ENTER] to set the adjusted data.

# - G. V Coordinate Adjustment

Set the speed.

Line up the cursor and press [SELECT] to display the number input buffer line.

Input the number data and press [ENTER] to set the adjusted data.

– H. PL

The position level of the job to be adjusted for the step set in "4. Step Number" is displayed, and the data can be modified.

When the position level is not decided, [-] is displayed, and cannot be set.

To modify the position level, line up the cursor, press [SELECT], input the number value and press [ENTER].

# Spot and Arc Welding Using Motor Gun

6 Convenient Functions 6.6 Mirror Shift Function

# 6.6 Mirror Shift Function

## 6.6.1 Function Overview

With the mirror shift function, a job is converted to the job in which the path is symmetrical to that of the original job. This conversion can be performed for the specified coordinate among the X-Y, X-Z, or Y-Z coordinate of the robot coordinates and the user coordinates.

The mirror shift function is classified into the following three: the pulse mirror-shift function, the robot-coordinates mirror-shift function, and the user-coordinates mirror-shift function.

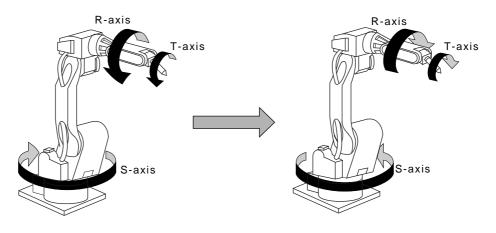

The original path before the mirror shift

The converted path after the mirror shift

- 6 Convenient Functions
- 6.6 Mirror Shift Function

## 6.6.2 Pulse Mirror-shift Function

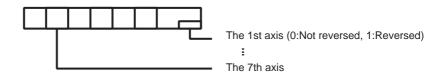

With the pulse mirror-shift function, the mirror shift is performed by reversing the sign (+/-) for the axes which are specified with the parameter in advance.

## 6.6.2.1 Parameter Setting

Using the following parameter, specify the axes for which the sign is to be reversed.

S1CxG065: Mirror Shift Sign Reversing Axis Specification

6.6.2.2 Object Job

Jobs without group axes and relative jobs cannot be converted.

## 6.6.2.3 Group Axes Specification

When specifying the group axes for the converted job in a multiple group axes system, the group axes specified in the original and converted jobs must be the same.

- Robot Axis: Same model
- Base Axis: Same configuration
- Station Axis: Same configuration

### 6.6.2.4 Position Variables

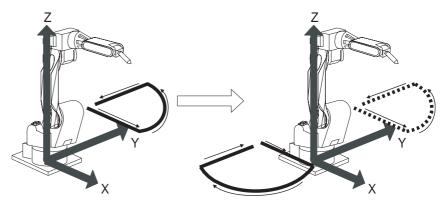

Position variables are not converted by the mirror shift function.

# Spot and Arc Welding Using Motor Gun

- 6 Convenient Functions
- 6.6 Mirror Shift Function

## 6.6.3 Robot-coordinates Mirror-shift Function

With the robot-coordinates mirror-shift function, the mirror shift is performed on the X-Z coordinate of the robot coordinates.

## 6.6.3.1 Object Job

Jobs without group axes cannot be converted.

### 6.6.3.2 Group Axes Specification

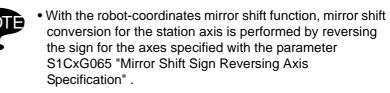

When specifying the group axes for the converted job in a multiple group axes system, the group axes specified in the original and converted jobs must be the same.

- Robot Axis: Same model
- Base Axis: Same configuration
- Station Axis: Same configuration

### 6.6.3.3 Position Variables

Position variables are not converted by the mirror shift function.

 Mirror shift conversion for the base axis is not performed with the robot-coordinates mirror shift function.

- 6 Convenient Functions
- 6.6 Mirror Shift Function

# 6.6.4 User-coordinates Mirror-shift Function

With the user-coordinates mirror-shift function, the mirror shift is performed on the X-Z, X-Y, or Y-Z coordinate of the specified user coordinates.

## 6.6.4.1 Object Job

Jobs without group axes cannot be converted.

## 6.6.4.2 Group Axes Specification

When specifying the group axes for the converted job in a multiple group axes system, the group axes specified in the original and converted jobs must be the same.

- Robot Axis: Same model
- Base Axis: Same configuration
- Station Axis: Same configuration

# 6.6.4.3 Position Variables

Position variables are not converted by the mirror shift function.

With the user-coordinates mirror shift function, mirror shift conversion for the station axis is performed by reversing the sign for the axes specified with the parameter S1CxG065 "Mirror Shift Sign Reversing Axis Specification".

# Spot and Arc Welding Using Motor Gun

- 6 Convenient Functions
- 6.6 Mirror Shift Function

# 6.6.5 Notes on the Mirror Shift Function

For manipulators, such as a polishing wrist, whose center of S-axis rotation and T-axis rotation are offset in the X-coordinate direction, the mirror shift cannot correctly be performed by the pulse mirror-shift function. Be sure to use the robot-coordinates mirror-shift function or use the user-coordinates mirror-shift function with the user coordinates specified on the center of the T-axis rotation.

 Using the Robot-coordinates Mirror-shift Function When the robot-coordinates mirror-shift function is performed, the mirror shift is performed on the X-Z coordinate of the robot coordinates. The path of the converted job is as follows:

Robot-coordinates Mirror-shift Conversion

After conversion Before conversion

(2) Using the User-coordinates Mirror-shift Function To use the user-coordinates mirror-shift function, specify the user coordinates on the center of T-axis rotation in advance.

User-coordinates Mirror-shift Conversion

## 6.6.6 Operation Procedures

6.6.6.1 Calling Up the JOB CONTENT Window

Call up the JOB CONTENT window of the job to be converted as follows:

# For Current Job

- 1. Select {JOB} under the main menu.
- 2. Select {JOB}.
- For Another Job
  - 1. Select {JOB} under the main menu.
  - 2. Select {SELECT JOB}.
    - The JOB LIST window appears.
  - 3. Select the desired job.

## 6.6.6.2 Mirror Shift Conversion

- 1. Display the JOB CONTENT window.
- 2. Select {UTILITY} under the pull-down menu.
  - The MIRROR SHIFT window appears.
- 3. Select {MIRROR SHIFT}.
  - The MIRROR SHIFT window appears.

## A. SOURCE JOB

Selects the conversion source job.

To select another job to be converted, move the cursor to the name and press [SELECT] to call up the list of jobs. Select the desired job and press [SELECT].

### **B. SOURCE CTRL GROUP**

Displays the control group of the conversion source job.

### **C. STEP SELECTION**

Specifies the steps to be converted. From the first step to the last step of the selected job are specified as initial value.

### **D. DESTINATION JOB**

Specifies the converted job name. To enter the name, move the cursor to the name and press [SELECT]. The name of the conversion source job is displayed in the input line as initial value. When "\*\*\*" is displayed, the name for the converted job is to be the same as that of the conversion source job.

### **E. DEST CTRL GROUP**

Selects the control group for the converted job. When the destination job name is entered, the same control group as the conversion source job is automatically set. To change it, move the cursor to the control group and press [SELECT] to call up the selection dialog box.

### F. COORDINATES

Specifies the coordinates used for conversion.

"PULSE": Executes the pulse mirror-shift conversion.

"ROBOT": Executes the mirror-shift conversion on the basis of the cartesian coordinates.

"USER": Executes the mirror-shift conversion on the basis of the specified user coordinates.

- 6 Convenient Functions
- 6.6 Mirror Shift Function

# G. USER COORD NO.

Specifies the user coordinates number when "USER" is selected in "6. COORDINATES".

This item cannot be set when "PULSE" or "ROBOT" is selected in "6. COORDINATES".

# H. TARGET

Specifies the coordinate where conversion is to be done when "ROBOT" or "USER" is selected in "6. COORDINATES". "XY", "XZ", or "YZ" can be selected. Always specify "XZ" for "ROBOT".

# I. EXECUTE

Mirror shift conversion is executed when pressing "EXECUTE" or [ENTER]. A job is created with the name of conversion source job when a job after conversion is not entered.

- 6 Convenient Functions
- 6.7 Multi Window Function

# 6.7 Multi Window Function

# 6.7.1 Function Overview

Multi window function divides the general-purpose display area up to 4 windows and shows them simultaneously.

There are seven dividing patterns to be optionally choose as necessary.

## Cancel the setting

- 1. Touch [CANCEL] button or move the cursor to it and press [SELECT] key.
  - Dividing pattern setting window closes. The dividing pattern in the general-purpose display area doesn't change.

The cursor moves by pressing [AREA] key in the dividing pattern setting window.

- 6 Convenient Functions
- 6.7 Multi Window Function

## 6.7.3 Displaying the Multi Window

6.7.3.1 Multi Window Mode and Single Window Mode

Specifying more than two-window pattern in the dividing pattern setting window shows plural windows simultaneously in the general-purpose display area.

This is called multi window mode.

On the other hand, a single active window can be displayed with pressing [SHIFT] + [MULTI] key operation.

This is called single window mode.

Pressing [SHIFT] + [MULTI] key operation switches the display from single window mode to multi window mode. The mode can be changed as necessary.

6.7.3.2 Displaying the Status of Plural (more than two) Window Dividing Pattern Setting

When more than two windows are displayed as a desired pattern,

appears on the upper part of the window whereas it doesn't appear when a single window is displayed.

# 6.7.5 Switching the Axis Operation Control Group

The appropriate control group for axis operation is automatically selected in accordance with the window status or its operation in the active window. Due to this function, when the general-purpose display area is in multi window mode, the control group for axis operation can vary depending on the window which is active at the time.

To avoid unexpected control group to function and for the better safeness, the change of the control group with the [MULTI] key operation or touching operation when switching the active window is notified to the user.

The change of the control group for axis operation due to other than [MULTI] key operation or touching operation; due to the switch of the window by selecting main menu, is not notified to the user.

6.7.5.1 S2C540 "Choosing Method of Notifying the Change of Axis Operation Control Group when Switching the Active Window"

The method to notify the change of control group for axis operation due to the switch of active window can be changed with parameter.

- Setting Value:0
- Keep displaying the message in the human interface display area for three seconds.
- Message "Control group switched by switching the active window" is displayed.

### 6.8.2.3 Conditions to Register the Layout

There are some cases that the layout patterns cannot be registered to "USER DEFINITION" menu.

Followings are the conditions and the messages that the layout is refused to register.

	Condition	Message
1	when the layout is already registered.	This layout is already registered.
2	when eight layouts are already registered.	There is not an undefined domain.
3	When the registering layout includes the window which cannot be started up from the main menu.	The screen which I cannot register is included [W1W2W3W4] The screen which I cannot register is included [III] (The number W1 to W4 indicates the windows which are actually displayed on the general-purpose display area, however, the highlighted numbered window cannot be registered. *For the layout of 1 to 4,refer to Table 6-3 Display the dividing Pattern on page 6-62.
4	When a single window is displayed under the multi window mode.	Cannot register at current operation mode. Cannot register at current operation mode

The screens which cannot be started up from the main menu are impossible to register.

Also, the layout of the screens that are called up from {FD/ PC CARD} or ladder editor (optional function) cannot be registered.

#### 6.8.2.4 The Displayed Layout Name

After a layout pattern is registered to "USER DEFINITION" menu, it is named in accordance with the status of the general-purpose display area when the layout pattern is created.

Refer to the followings for the details.

	Status of general- purpose display area	Name registered to "USER DEFINITION" Menu		
1	Single window mode	(Same as the sub menu in main menu)		
2	Multi window mode	Layout -n ("n" should be a number from 0 to 7)		

It is possible to change the name even after the name is registered. Refer to Section 6.8.4.3 "Change the Name of Registered Layout Name" on page 6-81.

6 Convenient Functions6.8 Simple Menu Function

# 6.8.3 Calling Up of the Registered Layout

6.8.3.1 Calling up

Call up the registered layout with the following procedures.

- 1. Press [SIMPLE MENU] key or select {Simple Menu} button at the lower-left on the display.

  - "USER DEFINITION" menu appears.

- 2. Select and press a button on "USER DEFINITION" menu to display a layout to be called up.
  - "USER DEFINITION" menu closes.
  - The selected layout appears on the general-purpose display area.

## 6.8.3.2 Conditions when Calling Up the Layout

There are some cases where the layout cannot be called up depending on the conditions when calling up.

Followings are the conditions and the messages that the layout is refused to be called up.

	Condition	Message
1	When all the registered layout windows cannot be displayed due to security mode or its purpose of use.	There are no windows to display within the chosen layout. There is not the screen which I can display in the layout that I chose

When undisplayed screen is included in the layout to be called up due to above mentioned reasons, the message, "Please selected a Main Menu" appears to the said screen.

### 6.8.4 Editing "USER DEFINITION" Menu

Editing procedures of "changing the registered name" and "deleting the registered item" are possible to the items registered to "USER DEFINITION MENU" window.

Those editions are executed on "USER DEFINITION MENU" window. Displaying of "USER DEFINITION MENU" window is possible in the operation mode or more and editing of this menu is possible in the editing mode or more.

### 6.8.4.1 Displaying "UNSER DEFINITION" Window

Displays "UNSER DEFINITION MENU" Window with {EDIT} button.

- 1. Press [SIMPLE MENU] key or select {Simple Menu} button at the lower-left on the display.
  - "USER DEFINITION MENU" menu appears.

## 6.10 Jog Key Allocation

## 6.10.1 Jog Key Allocation Function

This function enables to operate external axis without switching control groups by using operation keys of 7th-axis (E+, E-) and 8th-axis (8+,8-) on the programing pendant after setting any external axis to them.

This function can operate other control group than displayed in the upper part of the programming pendant (Status display area or the LED of [ROBOT] or [EX.AXIS] keys).

Also, the simultaneous operation of the robot and the external axes is possible by pressing several axis operational keys at a time. Please be careful to the axes movements when pressing them.

Spot and Arc Welding Using Motor Gun

- 6.11 Energy-Saving Function

#### -

## 6.11 Energy-Saving Function

### 6.11.1 Energy-Saving Function

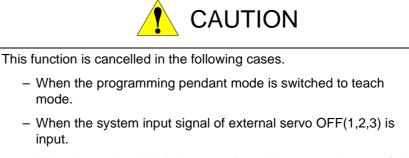

Energy-saving function is a function to save power by halting the power to the robot after applying brake to the motor when robot's all axes won't move for a designated period of time while servo is turned ON in play mode. The initial designated period of time is 10 minutes.

This energy-saving function is valid when all the following condition met.

- 1. Energy-saving function is valid.
- 2. The system input signal (signal to prohibit on energy-saving mode #40580) is turned OFF.

Followings are the status of the robot while this function is valid.

- 1. The message "On energy saving mode" is indicated on the programming pendant.
- 2. The servo is turned ON.
- 3. The jobs under execution are continuously executed.
- 4. The system output signal (ENERGY-SAVING:SOUT#0576(#50727))to indicate that it is in energy-saving status is turned ON while other signals won't change.

- When the axis, which belongs to the subject control group of the executing job, is about to move while energy-saving function is valid.
- In the cases where emergency stop or servo OFF is executed when alarming.

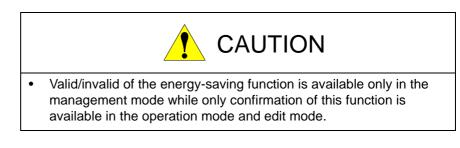

This function will not be cancelled if the system input signal (signal to prohibit energy-saving #40580) is turned ON. This signal merely prohibits to shift the status to energy-saving status.

## 6 Convenient Functions6.13 Present Manipulator Position Output Function

NOT

- When validating the command value register output function (S1CxG208=1), never fail to set the output register number (S1CxG210 to 216) of each coordinate value.
- When validating the FB value register output function (S1CxG217=1), never fail to set the output register number (S1CxG219 to 225) of each coordinate value.
- In case 2 bytes is set as the register output size (S1CxG209=1 or S1CxG218=1), the unit of X,Y and Zaxes coordinate value becomes "mm" and that of Rx, Ry, Rz and Re coordinate value becomes "deg". In both cases, only the lower 2 bytes are output.
- When setting 4 bytes to the register output size (S1CxG209=1 or S1CxG218=1), the unit of X,Y and Zaxes coordinate value becomes "µmm" and that of Rx, Ry, Rz and Re coordinate value becomes "0.0001deg".
- When setting 4 bytes to the register output size (S1CxG209=1 or S1CxG218=1), upper byte of the coordinate value is output to the following register number to the specified output register number. In this consequence, confirm the register's status of use before setting the output size to the register.

## 6.14 Softlimit Setting Function

### 6.14.1 About the Softlimit Setting Function

The softlimit setting function is a function to set the softlimit to limit the range of the manipulator motion in software.

### 6.14.2 The Softlimit Setting Screen

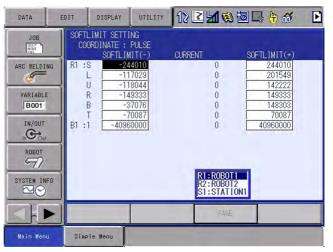

- 1. Select {ROBOT} in the main menu.
- 2. Select {SOFTLIMIT SETTING}.
  - The softlimit setting screen is displayed.

#### 6.14.4 Set the Current Value to the Softlimit

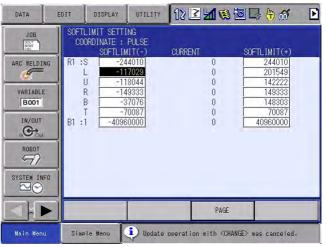

- 1. Move the manipulator by the axis key.
  - Move the manipulator to the position of which value is maximum number or minimum number of the softlimit by the axis key.
- 2. Move the cursor to the desired axis of the softlimit (+) or the softlimit (-).
  - When change the maximum number of the first softlimit, move the cursor to the first axis of the softlimit (+).
  - When change the minimum number of the first softlimit, move the cursor to the first axis of the softlimit (-).
- 3. Press [MODIFY].
  - The message [Update the data with <ENTER>.] appears.

					PAGE		
Main Menu	Simp	le Menu					

- 2. Select {Coordinate Change}.
  - When the displaying coordinate is a pulse, the robot axis is changed to the angle display; the base axis is changed to the distance display; and the station axes is changed for each axis by the value of the station axis display parameter (S2C265 to 288).

When the first bit is OFF, the first axis is changed to the angle display.

When the second bit is ON, the second axis is changed to the distance display.

When the display coordinate is angle/distance, the all axes are changed to the pulse display.

- When the display of the softlimit value is the angle display, the pulse display and the sign may be different.
- Be sure to confirm the motion range by the jog operation after changing the softlimit value.

6 Convenient Functions

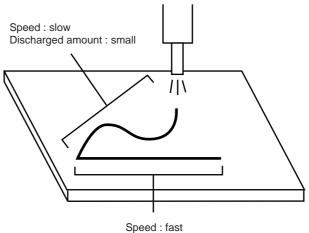

6.15 Analog Output Function Corresponding to Speed

## 6.15 Analog Output Function Corresponding to Speed

#### 6.15.1 Overview

The analog output function corresponding to speed changes the analog output value automatically, according to the manipulator operating speed. This function does not need resetting of the analog output value according to the operating speed, so that the time required for job teaching can be reduced.

For example, when the thickness of sealing or painting should be constant, the discharged amount of seals or paints can be controlled by the manipulator operating speed.

Discharged amount : large

For the analog output function corresponding to speed, the following board is needed.

Analog output expansion board: JANCD-YEW02-E

Spot and Arc Welding	6 Convenient Functions
Using Motor Gun	6.15 Analog Output Function Corresponding to Speed

#### 6.15.2 Instructions

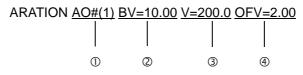

6.15.2.1 Instructions for Analog Output Function Corresponding to Speed

The instructions, ARATION and ARATIOF, are used for the analog output function corresponding to speed.

#### ARATION

The analog output function corresponding to speed is performed after executing ARATION instruction. This instruction is valid during circular interpolation, linear interpolation or spline interpolation. It is executed only at playback or FWD key operation; it is not executed during axis operation.

This instruction is also used when each set value for the analog output function corresponding to speed is to be changed.

#### **Output port number**

General analog output port to execute the analog output corresponding to speed

Setting range : 1 to 40

#### ②Basic voltage

Voltage to be output at the speed set with the basic speed.

Setting range : -14.00 to +14.00V

#### **3Basic speed**

Operating speed which becomes the basis for when the set voltage is output.

Setting range : 0.1 to 1500.0 mm/sec

1 to 9000 cm/min

#### **④Offset voltage**

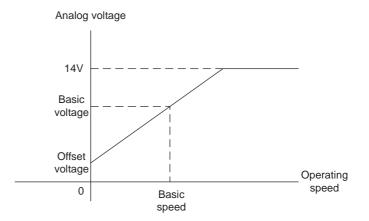

Analog voltage when the operating speed is 0. Setting range : -14.00 to +14.00V Spot and Arc Welding Using Motor Gun 6 Convenient Functions

6.15 Analog Output Function Corresponding to Speed

According to the set value of the ARATION instruction, the output characteristics for the relation between the operating speed and the analog voltage are calculated. The analog output function corresponding to speed is executed depending on these output characteristics.

The following graph shows the output characteristics.

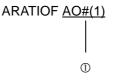

When the analog output value exceeds  $\pm$  14.00V because of the operating speed, the value is limited within  $\pm$  14.00V.

#### ARATIOF

When the ARATIOF instruction is executed, the analog output corresponding to speed is completed, and the set offset voltage becomes the fixed output.

#### **Output port number**

General analog output port to end the analog output corresponding to speed

Setting range : 1 to 40

#### 6.15.4 Filter Process

In the analog output function corresponding to speed, the output analog signal can be filtered by setting a filter constant at the parameters.

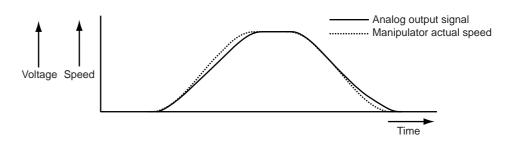

#### 6.15.4.1 When Parameter is Set to "0"

The analog signal according to the speed reference (the speed determined by a path operation) is output.

#### 6.15.4.2 When Parameter is Set to Values Other Than "0"

The analog signal according to the speed of filtered speed reference is output. By the filter process, the output signal can be close to the manipulator's actual speed.

#### 6.15.4.3 Parameter Setting

Adjust the settings of parameters during actual operations.

S3C1189	Analog output No.40	Primary filter constant	[msec]
S3C1190	Analog output No.40	Secondary filter constant	[msec]

Table 6-4: Parameter (Sheet 3 of 3)

The standard parameter settings are as follows.

- For small capacity robot with a payload 6 kg and 16 kg Primary filter constant : 50 msec Secondary filter constant : 50 msec
- For large capacity robot with a payload 60 kg and 130 kg Primary filter constant : 100 msec Secondary filter constant : 100 msec

6 Convenient Functions

6.15 Analog Output Function Corresponding to Speed

#### 6.15.5 Precautions

#### 6.15.5.1 When Analog Output Corresponding to Speed is Interrupted

If the manipulator is stopped for some reason and the editing operation is performed, the analog output corresponding to speed is interrupted. This interruption is performed in all output terminals, and the analog voltage fixed immediately before the interruption is output to each output terminal.

The analog output corresponding to speed is not interrupted in any other cases.

#### 6.15.5.2 When More than One Manipulator is Used

The attribute of the job where the instruction is executed determines the manipulator where the analog output corresponding to speed is performed.

For a coordinated job, the analog output corresponding to speed is performed at the operating speed of the manipulator at the slave side.

Using Motor Gun

- 7 External Memory Devices
- 7.1 Memory Devices

## 7 External Memory Devices

## 7.1 Memory Devices

The following memory devices can be used in the DX100 to save and load data such as jobs and parameters.

Device	Function	Media (destination of saved/ loaded data)	Optional function requirement
CF: Pendant	Standard	Compact Flash Card (CF card)	No requirement. Programming pendant is equipped with a slot.
USB: Pendant	Standard	USB Memory Stick	No requirement. Programming pendant is equipped with a slot.
FC1	Optional <sup>1)</sup>	2DD floppy disk, personal computer (FC1 emulator)	"FC1"or personal computer with "FC1 emulator"
FC1 (DX)	Optional <sup>1)</sup>	Personal computer (FC1 emulator)	Personal computer with "FC1 emulator"
FC2	Optional <sup>1)</sup>	2DD floppy disk, 2HD floppy disk	"FC2"
PC	Optional <sup>1)</sup>	Personal computer (MOTOCOM32 host)	Via RS-232C: "Data transmission function"and "MOTOCOM32" Via Ethernet: "Ethernet function" plus above two requirements
FTP	Optional <sup>1)</sup>	FTP server such as personal computer	"Data transmission function", "MOTOCOM32", and "FTP function"

1 For the operation, refer to instruction manuals for each optional function.

- 7 External Memory Devices
- 7.1 Memory Devices

#### 7.1.1 Compact Flash (CF Cards)

The programming pendant is equipped with CF card slot. Use the FAT16 or FAT32 formatted Compact Flash.

#### 7.1.1.1 Recommended Compact Flash Cards

Refer to "9.1.2 Device" in "DX 100 INSTRUCTIONS (162536-1CD)" for the recommended products used for external memory of DX100. Model numbers are subject to be updated due to termination of product and new addition. Contact Yaskawa representative when necessary.

#### 7.1.1.2 Notes on handling Compact Flash

- Do not drop or bend exerting any shock or strong force to the Compact Flash.
- Keep away from water, oil, organic solvent, dust, and dirt.
- Do not use or keep the Compact Flash in places where strong static electricity or electronic noise may occur.
- Do not insert or remove the Compact Flash or turn OFF the power when accessing the Compact Flash (writing-in or reading-out the Compact Flash data).
- To protect the data, back up the data regularly on other media. Damages or loss of data due to operation errors or accidents can be minimized.

\*Compact Flash has a limited life span.

The life span differs depending on products or status of use. However, normal use of Compact Flash as an external memory device for the DX100 does not adversely affect the Compact Flash. For details, refer to instruction manuals for each medium.

|--|

Spot and Arc Welding
Using Motor Gun

#### 7.1.1.3 Inserting a Compact Flash

When inserting a Compact Flash, take note of insertion direction.

With the notch and clip of the Compact Flash downward, insert the Compact Flash slowly into the slot of the programming pendant of which display faces up.

Forcible insertion may result in damage to the Compact Flash or CF card slot.

After inserting the card, be sure to close the cover of the slot before starting operation.

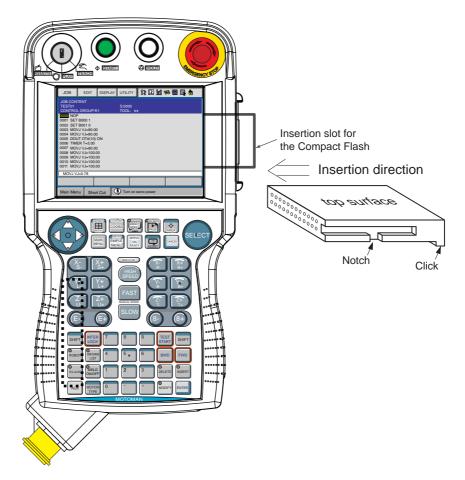

Fig. 7-1: Using a Compact Flash Card

#### 7 External Memory Devices

7.1 Memory Devices

#### 7.1.2 USB Memory Stick

The programming pendant is equipped with a USB connector. Use the FAT16 or FAT32 formatted USB memory stick.

#### 7.1.2.1 Recommended USB Memory Stick

Refer to "9.1.2 *Device" in "DX 100 INSTRUCTIONS* (162536-1CD)" for the recommended products used for external memory of DX100. Model numbers are subject to be updated due to termination of product and new addition. Contact Yaskawa representative when necessary.

#### 7.1.2.2 Notes on handling USB Memory Stick

- Do not drop or bend exerting any shock or strong force to the Compact Flash.
- Keep away from water, oil, organic solvent, dust, and dirt.
- Do not use or keep the Compact Flash in places where strong static electricity or electronic noise may occur.
- Do not insert or remove the Compact Flash or turn OFF the power when accessing the Compact Flash (writing-in or reading-out the Compact Flash data).
- To protect the data, back up the data regularly on other media. Damages or loss of data due to operation errors or accidents can be minimized.

\*USB memory stick has a limited life span.

The life span differs depending on products or status of use. However, normal use of USB memory stick as an external memory device for the DX100 does not adversely affect the USB memory stick. For details, refer to instruction manuals for each medium.

## Spot and Arc Welding Using Motor Gun

7 External Memory Devices7.1 Memory Devices

### 7.1.2.3 Inserting a USB Memory Stick

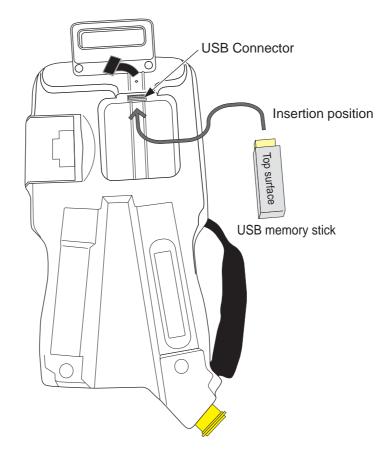

When inserting a USB memory stick, take note of insertion direction.

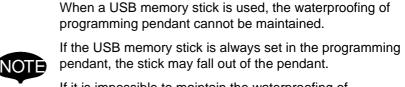

With the USB memory stick face-up and the connector upwards, insert the stick slowly into the slot of the programming pendant of which display face-down.

Forcible insertion may result in damage to the USB memory stick or USB connector.

After inserting the stick, be sure to close the cover of the connector before starting operation.

Fig. 7-2: Using a USB Memory Stick

If it is impossible to maintain the waterproofing of programming pendant or to prevent the USB memory stick from falling out of the programming pendant, use a Compact Flash card instead.

- 7 External Memory Devices
- 7.2 Handling Data

### 7.2 Handling Data

#### 7.2.1 Data Classification

For the DX100, data that can be saved online are classified into eight categories.

- 1. JOB
- 2. FILE/GENERAL DATA
- 3. BATCH USER MEMORY<sup>\*1</sup>
- 4. PARAMETER<sup>\*2</sup>
- 5. SYSTEM DATA
- 6. I/O DATA
- 7. BATCH CMOS<sup>\*3</sup>
- 8. ALL CMOS AREA<sup>\*4</sup>

Data saved on the external memory device can be loaded again into the DX100.

Each data in the eight categories varies depending on applications or options.

When the device is set to "PC" and "FTP", data cannot be handled other than "1. JOB" and "2. FILE/GENERAL DATA".

Also, the "1. JOB" whose name consists of more than nine letters cannot be handled at "FC1" and "FC2".

- \*1: "3. BATCH USER MEMORY" includes "1. JOB" and "2. FILE/ GENERAL DATA".
- \*2: "PARAMETER BATCH" includes all "P4. PARAMETER".
- \*3: "7. BATCH CMOS" includes "3. BATCH USER MEMORY", "4. PARAMETER", "5. SYSTEM DATA", and "6. I/O DATA".
- \*4:"ALL CMOS AREA" data cannot be loaded in edit mode and management mode.

PARAMETER, I/O DATA, SYSTEM DATA, PARAMETER BATCH, BATCH CMOS, and ALL CMOS AREA are used for backup.

If those data are loaded by other controllers, unintended data overwriting, unexpected operation, or abnormal system startup may occur.

Do not load those backup data into other controllers.

If two controllers are loaded with the same job, paths of the two manipulators are different due to the home positions or mechanical error of the component parts.

Be sure to check the operation instruction before operation.

The data such as variable data, user coordinate data, job data, parameter data and each condition file data should not be changed during saving the ALL CMOS AREA, SYSTME DATA and BATCH USER MEMORY.

Changing the those data may cause incorrect saving as well as during the playback.

## Spot and Arc Welding Using Motor Gun

- 7 External Memory Devices
- 7.2 Handling Data

#### 7.2.2 File Existence

The following data categories show whether the same file name as a file that is going to be saved is in the external memory device or not.

• JOB

No mark appears when the selected folder has the file of the same name.

The asterisk (\*) appears when the folder does not have the same name file.

 FILE/GENERAL DATA, PARAMETER, SYSTEM DATA, I/O DATA Black circle (

 ) appears when the selected folder has the file of the same name.

White circle (  $\,\circ\,$  ) appears when the folder does not have the same name file.

Whether the job after editing is saved or not can be judged by checking "TO SAVE TO FD" in the JOB HEADER window. However, the status of "TO SAVE TO FD" does not change after saving "3. BATCH USER MEMORY" and "7. BATCH CMOS".

### Fig. 7-3: Example of JOB

- 7 External Memory Devices
- 7.2 Handling Data

#### 7.2.2.1 Saving by Overwriting

"3. BATCH USER MEMORY", "7. BATCH CMOS", and "8. ALL CMOS AREA" can be overwritten.

As for "1. JOB", "2. FILE/GENERAL DATA", "4. PARAMETER", "5. SYSTEM DATA", and "6. I/O DATA", those data cannot be overwritten. Delete the target file in the device before the saving operation. If Compact Flash is used as the device, the file does not need to be deleted because another folder can be created to save the data.

## Spot and Arc Welding Using Motor Gun

- 7 External Memory Devices
- 7.3 Operation Flow

## 7.3 Operation Flow

The following description is the operation flow for external memory devices.

 SELECT DEVICE Select {FD/PC CARD} --> {DEVICE}, and the destination device for saving.

The device selected is valid after turning the power supply ON again. \*1: Sub menu {FORMAT} appears when selecting FC1 or FC2.

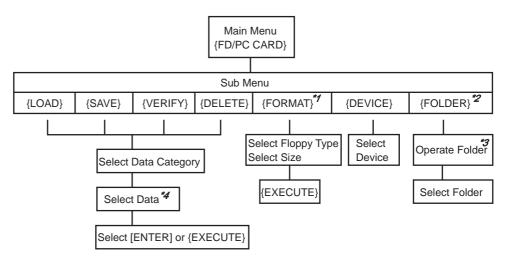

• SELECT FOLDER

Select {FD/PC CARD} --> {DEVICE}, and the destination folder for saving.

The folder selected is invalid after turning the power supply ON again.

\*2: {FOLDER} appears when using the Compact Flash as a device. \*3 The settings of {CREATE NEW FOLDER}, {DELETE FOLDER}, and {ROOT FOLDER} can be set.

- SELECT SUB MENU Select an operation to be performed from {LOAD}, {SAVE}, {VERIFY}, and {DELETE}.
- SELECT DATA CATEGORY Select the target data category.
- SELECT DATA Select the target data.
  "3. BATCH USER MEMORY", "7. BATCH CMOS", and "8. ALL CMOS AREA" do not require this operation.
  \*4 Individual selection, batch selection, marker (\*) selection, and canceling selection can be performed.
- EXECUTE Select [ENTER] or {EXECUTE}.

7.3 Operation Flow

#### 7.3.0.1 Operating a Folder

Folders can be used in order to classify and sort out the data such as jobs and condition files when using the Compact Flash. The folders can be created in hierarchical structure positioning a root folder at the top.

#### Restrictions

Folder name: Up to 8 one-byte characters + 3 characters for extension

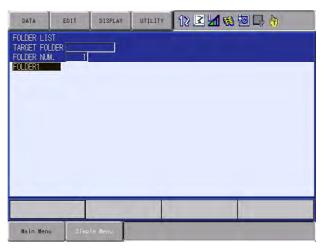

\*Long folder names cannot be used such as the name that exceeds the restricted number of characters mentioned above as created in PC, etc.

Maximum path length: 42 one-byte characters

\*"ERROR 3360: INVALID FOLDER" appears when selecting the folder of which name exceeds the maximum path length.

#### Selecting a Folder

- 1. Select {FD/PC CARD} under the main menu.
- 2. Select {FOLDER}.
  - The FOLDER LIST window appears.
- 3. Move the cursor to a folder and press [SELECT].
  - A folder can be selected.
- 4. To move the hierarchy from a child folder to a parent folder, move the cursor to [..] and press [SELECT].

#### Creating a Folder

- 1. Change the security to management mode. Select {FD/PC CARD} under the main menu.
- 2. Select {FOLDER}.
  - The FOLDER LIST window appears.

163543-1CD	

163543-1CD Spot and Arc Welding Using Motor Gun	<ul><li>7 External Memory Devices</li><li>7.3 Operation Flow</li></ul>
	3. Move the cursor to a folder and press [SELECT].
	<ul> <li>Select the higher-level folder where a new folder to be created should be contained.</li> </ul>
	<ul> <li>When creating a folder in top-level, this step is unnecessary.</li> </ul>
	<ol> <li>Select {DATA}&gt; {CREATE NEW FOLDER} under the pull-down menu. Input folder name using the keyboard on the screen and press [ENTER].</li> </ol>

- A folder is created.

## **Deleting a Folder**

- 1. Change the security to management mode. Select {FD/PC CARD} under the main menu.
- 2. Select {FOLDER}.
  - The FOLDER LIST window appears.
- 3. Move the cursor to a folder and press [SELECT].
  - Select the higher-level folder where a folder to be deleted is contained.
  - When deleting a folder in top-level, this step is unnecessary.
- 4. Delete the files and subfolders beforehand inside the folder that is to be deleted.
  - A folder cannot be deleted if the folder contains files or subfolders inside.

Move the cursor to the folder to be deleted.

5. Select {DATA} --> {DELETE FOLDER} under the pull-down menu.

- 7 External Memory Devices
- 7.3 Operation Flow

#### Initial Folder Setting

The folder that is contained in a deep hierarchy can be selected in a shortened operation.

When selecting {LOAD}, {SAVE}, {VERIFY}, or {DELETE} from the sub menu of {FD/PC CARD}, the folder that has been set as an initial folder becomes a current folder.

- 1. Change the security to management mode. Select {FD/PC CARD} under the main menu.
- 2. Select {FOLDER}.
  - The FOLDER LIST window appears.
- 3. Move the cursor to a folder and press [SELECT].
  - Select a folder that is to be set as a root folder.
- 4. Select {DISPLAY} --> {ROOT FOLDER} under the pull-down menu.
  - The INITIAL FOLDER SETTING window appears.

DATA	EDIT	DISPLAY	UTILITY	12 🗳 🖬 🕏	s 10 🕞 🙌

- 7.3 Operation Flow
- 5. Select {EDIT} --> {SETUP FOLDER} under the pull-down menu. Move the cursor to "AUTO CHANGE" and press [SELECT].
  - The initial folder is set in "ROOT FOLDER".

DATA	EDIT	DISPLAY	UTILITY	12 🗷 📶 👒 🔟 🗔 👆
IC:/FOL	NT FOLDER	AUTO (	CHANGE ON	
Main Men	J Simp	le Menu		

 "AUTO CHANGE" shows "ON" and the initial folder setting becomes valid. Subsequently, every time {FD/PC CARD} --> {FOLDER} is selected, the initial folder that has been set becomes a current folder.

When the initial folder is missing due to exchange of the Compact Flash, etc., "ERROR 3360: INVALID FOLDER" appears when selecting {LOAD}, {SAVE}, {VERIFY}, {DELETE} or {FOLDER} menu from {FD/PC CARD}, and simultaneously the initial folder becomes invalid. Set "ON" in "AUTO CHANGE" when the initial folder setting needs to be valid.

- 7 External Memory Devices
- 7.3 Operation Flow
- 7.3.0.2 Saving Data

To download data from the memory of the DX100 to the external memory device, perform the following procedure.

Data such as PARAMETER, SYSTEM DATA, I/O DATA, and the batch data such as PARAMETER BATCH, BATCH CMOS, ALL CMOS AREA, that include PARAMETER, SYSTEM DATA, I/O DATA, contain the information specific to each robot controller.

Those data are prepared as backup data for reloading into the controller used for saving.

Loading the data from other controller may result in destruction or loss of critical system information.

Take extra care for the saved data.

#### Saving a Job

- 1. Select {FD/PC CARD} under the main menu.

7.3.0.3 Loading Data

To upload data from the external memory device to the memory of the DX100, follow the procedure in the following.

Data such as PARAMETER, SYSTEM DATA, I/O DATA, and the batch data such as PARAMETER BATCH, BATCH CMOS, ALL CMOS AREA, that include PARAMETER, SYSTEM DATA, I/O DATA, contain the information specific to each robot controller.

Those data are prepared as backup data for reloading into the controller used for saving.

Loading the data from other controller may result in destruction or loss of critical system information.

Take extra care for the saved data.

- Loading a Job
  - 1. Select {FD/PC CARD} under the main menu.
  - 2. Select {LOAD}.

## 7.3.0.6 Job Selection Mode

The method of selecting a job and various data files when loading, saving, verifying, and deleting are described in the following:

- Individual Selection Jobs and data files are selected individually one at a time.
- Batch Selection Jobs and data files are selected all at one time.
- Marker (\*) Selection
   Loading: selects the files in the external memory device.
   Saving: selects the files in the memory of the DX100.
   Verifying: selects both the files in the external memory device and in the memory of the DX100.

## Using Individual Selection

1. In either the external memory JOB LIST window or the file selection window, move the cursor to a job or a file to be selected.

- 8 Parameter
- 8.1 Parameter Configuration

# 8 Parameter

## 8.1 Parameter Configuration

The parameters of DX100 can be classified into the following seven:

Motion Speed Setting Parameter

Determines the manipulator motion speed for jog operation at teaching, test operation, or playback operation.

Mode Operation Setting Parameter

Makes the setting for various operations in the teach mode or remote mode.

Parameter according to Interference Area

Limits the P-point maximum envelope of the manipulator or sets the interference area for axis interference or cubic interference.

Parameter according to Status I/O

Sets the parity check or I/O setting for user input/output signals.

Parameter according to Coordinated or Synchronized Operation

Makes the settings for coordinated or synchronized operations between manipulators or between manipulators and stations.

Parameter for Other Functions or Applications

Makes the settings for other functions or applications.

Hardware Control Parameter

Makes the hardware settings for fan alarm or relay operation, etc.

### S1CxG Parameters

The initial setting of S1CxG parameters depends on the manipulator model.

For a system in which two manipulators are controlled, the following two types of parameters are used: S1C1G type and S1C2G type.

## Spot and Arc Welding Using Motor Gun

8 Parameter

8.2 Motion Speed Setting Parameters

## 8.2 Motion Speed Setting Parameters

These parameters set the manipulator motion speed for jog operation at teaching, test operation, or playback operation.

## 8.2.0.1 S1CxG000: IN-GUARD SAFE OPERATION MAX. SPEED

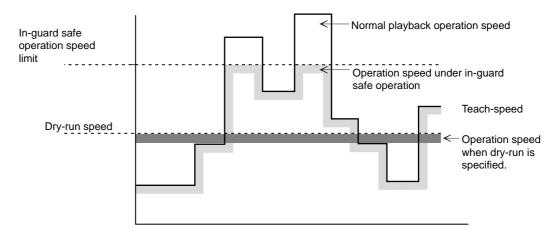

### Units: 0.01%

The upper speed limit is set for in-guard safe operation. While the inguard safe operation command signal is being input, the TCP speed is limited to the TCPmax speed.

## 8.2.0.2 S1CxG001: DRY-RUN SPEED

### Units: 0.01%

This is a dry-run operation speed setting value used when checking the path. Take safety into consideration when setting changes are unnecessary.

## 8.2.0.3 S1CxG002 to S1CxG009: JOINT SPEED FOR REGISTRATION

#### Units: 0.01%

The value set in these parameters is registered as the joint speed for each speed level when teaching the position data with the programming pendant. The percentage corresponding to the set value at each level is registered as 100% of the value set in the playback speed limit. Values greater than those set as speed limit values cannot be set.

```
S1CxG002: Level 1
S1CxG003: Level 2
.
.
S1CxG009: Level 8
```

Spot and Arc Welding Using Motor Gun

8 Parameter

8.2 Motion Speed Setting Parameters

## 8.2.0.4 S1CxG010 to S1CxG017: LINEAR SPEED FOR REGISTRATION

Units: 0.1mm/s

The value set in these parameters is registered as the linear speed for each speed level when teaching the position data with the programming pendant. Values greater than those set as playback speed limit values cannot be set.

S1CxG010: Level 1 S1CxG011: Level 2

#### S1CxG017: Level 8

### 8.2.0.5 S1CxG018 to S1CxG025: POSITION ANGLE SPEED

#### Units: 0.1°/s

The value set in these parameters is registered as the position angle speed for each speed level when teaching the position data with the programming pendant. Values greater than those set as playback speed limit cannot be set.

S1CxG018: Level 1 S1CxG019: Level 2 . . S1CxG025: Level 8

#### 8.2.0.6 S1CxG026 to S1CxG029: JOG OPERATION ABSOLUTE VALUE SPEED

#### Units: 0.1mm/s

These are setting values of jog operation speed set by the programming pendant. Values greater than those set as jog operation speed limit value cannot be set.

S1CxG026	Low level	:	Jog operation speed when "LOW" manual speed is specified.
S1CxG027	Medium level	:	Jog operation speed when "MEDIUM" manual speed is specified.
S1CxG028	High level	:	Jog operation speed when "HIGH" manual speed is specified.
S1CxG029	High-speed-level	:	Jog operation speed when [HIGH SPEED] is pressed.

163543-1CD Spot and Arc Welding Using Motor Gun		<ul><li>8 Parameter</li><li>8.2 Motion Speed Setting Parameters</li></ul>			
8.2.0.7	S1CxG030 to S1C	1CxG032: INCHING MOVE AMOUNT			
		These parameters specify the amount per move at inching operation by the programming pendant. The referenced parameter differs according to the operation mode at inching operation.			
		S1CxG030 : Joint Operation (Unit: 1 pulse)			
		S1CxG031 : Cartesian/cylindrical (Unit: 0.001 mm)			
		S1CxG032 : Motion about TCP (Unit: 0.001 degree)			
		SUPPLE- MENT If the value set for S1CxG031 or S1CxG032 is too small, the inching operation does not proceed.			
		Note that the units of S1CxG031 and S1CxG032 are smaller than those for the NX100.			
8.2.0.8	S1CxG033 to S1C	G040: POSITIONING ZONE			

This parameter value will be referenced when positioning is specified with the "MOVE" instruction: MOVJ (joint movement) or MOVL (linear movement).

<**Example>** MOVL V=100.0 <u>PL</u>=<u>1</u>

Positioning level
Positioning specification

The value set in this parameter specifies the range to enter in relation to the teaching point for that step positioning. After entering the specified positioning zone, the manipulator starts moving to the next step. The system is also set up so inward turning operation is carried out in the moving section when moving to the next path; speed changeover is smooth.

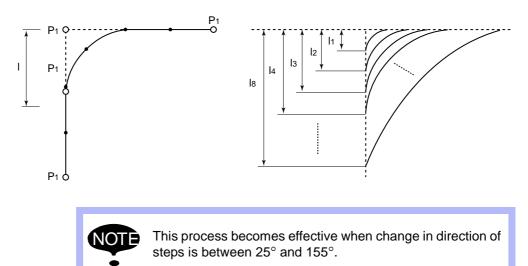

S1CxG033: Positioning level 1 S1CxG034: Positioning level 2

S1CxG040: Positioning level 8

# Spot and Arc Welding Using Motor Gun

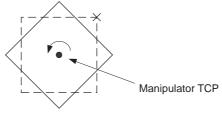

- 8 Parameter
- 8.2 Motion Speed Setting Parameters

Since operation will be turning inward during playback, as shown in the following diagram, use setting values taking safety aspects into consideration.

	Position Level
	<ul> <li>Position levels are divided into nine stages of 0 to 8 with the "MOV" instruction.</li> <li>e.g. MOVL V=500 PL=1 (PL:Position Level)</li> <li>The functions at each level are as follows:</li> <li>0: Complete positioning to the target point</li> <li>1 to 8: Inward turning operation</li> <li>Following are explanations of the respective processing details and their relations with the parameter.</li> </ul>
SUPPLE- MENT	<ul> <li>Level 0         Determines positioning completion when the amount of deviation (number of pulses) to the target point of each axis comes within the position set zone specified by the parameter.         After the positioning completes, the instruction system starts instruction to the next target point.     </li> </ul>
	<ul> <li>Level 1 to 8 Recognizes virtual positioning before the target point. The distance of the virtual target position from the target point is specified at the positioning level. Distance data corresponding to each level are set in the parameter. Determination of the virtual target position is carried out in the instruction system. Set zone: The zone of each positioning level set in the parameter. (μm)</li> </ul>

Spot and Arc Welding Using Motor Gun	8 Parameter 8.2 Motion Speed Setting Parameters			
8.2.0.9 S1CxG044: LOW	- SPEED START			
	Units: 0.01%			
	This parameter specifies max. speed at low speed start. Specify the starting method for "initial operation speed of manipulator" (S2C217).			
8.2.0.10 S1CxG045 to S <sup>2</sup>	1CxG048: JOG OPERATION LINK SPEED			
	Units: 0.01%			
	These parameters prescribe the link speed at jog operation by the programming pendant. Specify the percentage (%) for the jog operation speed limit, the joint max. speed.			
	S1CxG045: Jog operation link speed at level "LOW"			
	S1CxG046: Jog operation link speed at level "MEDIUM"			
	S1CxG047: Jog operation link speed at level "HIGH"			
	S1CxG048: Jog operation link speed at level "HIGH SPEED"			
8.2.0.11 S1CxG056: WO	RK HOME POSITION RETURN SPEED			
	Units: 0.01%			
	This parameter specifies the speed for returning to work home position against the maximum speed.			
8.2.0.12 S1CxG057: SEA	ARCH MAX. SPEED			
	Units: 0.1mm/s			
	This parameter specifies the max. speed for searching.			
8.2.0.13 S2C201: POSTI	JRE CONTROL AT CARTESIAN OPERATION OF JOG			
	This parameter specifies whether or not posture control is performed at cartesian operation of "JOG" by the programming pendant. Use posture control unless a special manipulator model is used.			
	0 : With posture control			
	1 : Without posture control			
	ATION IN USER COORDINATE SYSTEM (WHEN EXTERNAL POINT CONTROL FUNCTION USED)			
	This parameter specifies the TCP or reference point of motion about TCI when the external reference point control function is used and the user			
	coordinate system is selected by the programming pendant.			

- Spot and Arc Welding Using Motor Gun
- 8 Parameter
- 8.2 Motion Speed Setting Parameters

#### 8.2.0.15 S2C320: CONTROLLED GROUP JOB TEACHING POSITION CHANGE

This parameter is used to change only the job teaching position of controlled group axis.

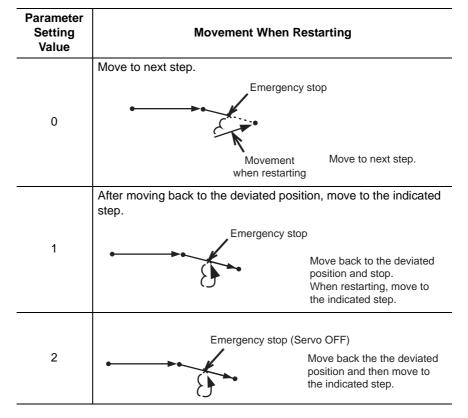

- 0 : Not changed
- 1 : Changed

## 8.2.0.16 S2C422: OPERATION AFTER RESET FROM PATH DEVIATION

#### 8.2.0.17 S2C423: OPERATION AFTER JOB

These parameters specify the method of restarting the manipulator that has deviated from the normal path such as an emergency stop or jog operation.

- 0 : Move to the indicated step (initial setting).
- 1 : After moving back to the deviated position, move to the indicated step.
- 2 : Move back to the deviated position and stop.

#### Table 8-1: S2C422

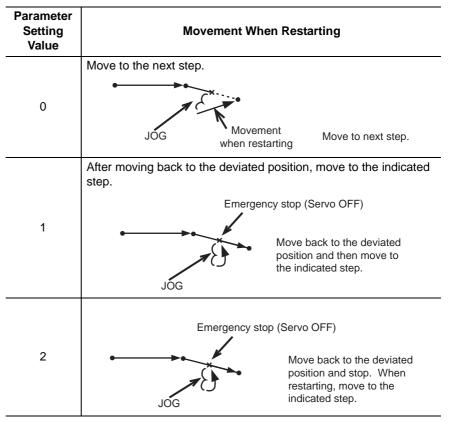

## Spot and Arc Welding

## Using Motor Gun

8 Parameter

8.2 Motion Speed Setting Parameters

#### Table 8-2: S2C423

To the path deviated position, the manipulator moves in a straight line at low speed operation (SICxG044). It is linear movement. After resetting from deviation, the speed becomes the same as taught speed.
The initial setting (prior to shipping) is 0: The manipulator moves in a straight line from the present position to the

### 8.2.0.18 S2C424: DEVIATED POSITION

This parameter specifies whether deviated position is to be robot current (reference) position or feedback position.

0 : Return to the feedback position.

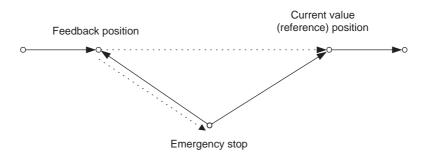

indicated step.

1 : Return to the current value (reference) position.

Spot and Arc Welding Using Motor Gun

- 8 Parameter
- 8.2 Motion Speed Setting Parameters

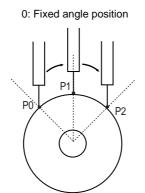

When emergency stop is applied during high-speed motion, the deviated position differs from the robot current value (reference) position and feedback position as shown in the following.

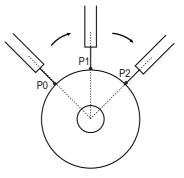

#### 8.2.0.19 S2C425: CIRCULAR INTERPOLATION TOOL POSITION CONTROL

This parameter selects tool position control methods at circular interpolation operation.

- Fixed angle position
   Interpolation is performed depending on the position change viewed from
   the base coordinate.
   As the figure below (left) shows, when tool position viewed from outside is
   not significantly changed and that position is mainly taught at teaching, this
   setting is required.
- Rotating position by circular arc path Interpolation is performed depending on the position change corresponding to circular arc path.
   As the figure below (right) shows, when tool position corresponding to circular arc path (tool position viewed from the center of the circular arc) is not significantly changed, and that position is mainly taught at teaching, this setting is required.

1: Rotating position by circular arc path

#### 8.2.0.20 S2C653: EMERGENCY STOP CURSOR ADVANCE CONTROL FUNCTION

This parameter specifies whether to use the cursor advance control function or not.

- 0: Not use
- 1: Use

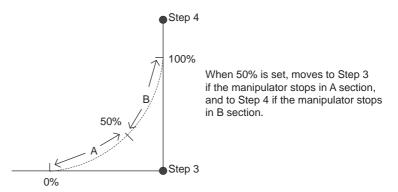

## Spot and Arc Welding Using Motor Gun

- ing 8 Parameter
  - 8.2 Motion Speed Setting Parameters

## 8.2.0.21 S2C654: EMERGENCY STOP CURSOR ADVANCE CONTROL FUNCTION CONT PROCESS COMPLETION POSITION

### Units: %

When the manipulator stops during moving inner corner by CONT process, this parameter specifies which position of the inner corner should be considered as the end of step.

# 8.2.0.22 S2C655: EMERGENCY STOP ADVANCE CONTROL FUNCTION WORK START INSTRUCTION STEP MOTION COMPLETION DELAY TIME

### Units: ms

In order to recognize securely the completion of motion to the step of work start instruction (such as ARCON instruction), this parameter specifies the delay time for motion completion of the work start instruction step only.

## 8.2.0.23 S2C698: BASE AXIS OPERATION KEY ALLOCATION SETTING

	0 0 1	,
Coordinates/Parameter	S2C698= "0"	S2C698= "1"
Joint	Axis number order	Specified
Cylindrical	Axis number order	Specified
Cartesian	Specified	Specified
Tool	Specified	Specified
User	Specified	Specified

Table 8-3: Parameter Setting and Jog Operation Key Allocation

Axis number order: X: First axis, Y: Second axis, Z: Third axis

Specified: X: X-direction (RECT-X), Y: Y-direction (RECT-Y), Z: Z-direction (RECT-Z)

Spot and Arc Welding Using Motor Gun

8 Parameter

8.2 Motion Speed Setting Parameters

8.2.0.24 S3C1098 to S3C1102: POSITION CORRECTING FUNCTION DURING PLAYBACK

These parameters specify the necessary data for position correcting function (PAM) during playback operation.

S3C1098	Specifies the limit of position correcting range (Units: $\mu m$ )
S3C1099	Specifies the limit of speed correcting range (Units: 0.01%)
S3C1100	Specifies the correcting coordinates 0 : Base 1 : Robot 2 : Tool 3 : User 1 to 26:User 24
S3C1102	Specifies the limit of posture angle adjustment range (Units: $0.01^\circ)$

# Spot and Arc Welding Using Motor Gun

- 8 Parameter
  - 8.3 Mode Operation Setting Parameters

## 8.3 Mode Operation Setting Parameters

These parameters set various operations in the teach mode or remote mode.

Some parameters can be set through {SETUP}  $\rightarrow$  {TEACHING COND} or {OPERATE COND}.

## 8.3.0.1 S2C195: SECURITY MODE WHEN CONTROL POWER SUPPLY IS TURNED ON

The operation level when the control power supply is turned ON is set.

- 0 : Operation Mode
- 1 : Editing Mode
- 2 : Management Mode

## 8.3.0.2 S2C196: SELECTION OF CARTESIAN/CYLINDRICAL

This parameter specifies whether the cartesian mode or cylindrical mode is affected when cartesian/cylindrical mode is selected by operation (coordinate) mode selection at axis operation of programming pendant. This specification can be done on the TEACHING CONDITION window.

- 0 : Cylindrical mode
- 1 : Cartesian mode

## 8.3.0.3 S2C197: COORDINATE SWITCHING PROHIBITED

This parameter prohibits switching coordinates during JOG operation by the programming pendant.

- 0 : Switching permitted for tool coordinates and user coordinates
- 1 : Switching prohibited for tool coordinates
- 2 : Switching prohibited for user coordinates
- 3 : Switching prohibited for tool coordinates and user coordinates

## 8.3.0.4 S2C198: EXECUTION UNITS AT "FORWARD" OPERATION

This parameter specifies the execution units at step mode of "FORWARD" operation by the programming pendant.

Parameter Setting Value	Operation Units		
0	MOVL DOUT TIMER DOUT MOVL		Stops at every instruction
1	MOVL DOUT TIMER DOUT MOVL		Stops at move instruction

Spot and Arc Welding Using Motor Gun

8 Parameter

8.3 Mode Operation Setting Parameters

8.3.0.5 S2C199: INSTRUCTION (EXCEPT FOR MOVE) EXECUTION AT "FORWARD" OPERATION

This parameter specifies the method of instruction (except for move) execution at "FORWARD" operation by the programming pendant.

- 0 : Executed by pressing [FWD] + [INTERLOCK]
- 1 : Executed by pressing [FWD] only
- 2 : Instruction not executed

#### 8.3.0.6 S2C203: CHANGING STEP ONLY

This parameter specifies whether to permit only step changes in an editing-prohibited job. When permitted, only position data can be changed but additional data such as speed cannot be changed. This specification can be done on the TEACHING CONDITION window.

- 0 : Permitted
- 1 : Prohibited

#### 8.3.0.7 S2C204: MANUAL SPEED STORING FOR EACH COORDINATE

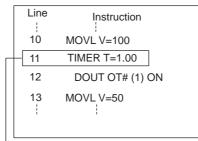

This parameter specifies whether to assign different manual speeds for the joint coordinates and other coordinates. If "NOT STORED" is selected, manual speed is not affected by changing the coordinates. If "STORED" is selected, manual speeds can be selected separately for the joint coordinates and other coordinates.

- 0 : Not stored
- 1 : Stored

#### 8.3.0.8 S2C206: ADDITIONAL STEP POSITION

This parameter designates either "before next step" or "after the cursor position (between instructions)" as additional step position. This specification can be done on the TEACHING CONDITION window.

Fig. 8-3: <Example>

Cursor position

Fig. 8-4: S2C206-0 (Before the Next Step)

Line	Instruction
	1
10	MOVL V=100
11	TIMER T=1.00
12	DOUT OT#(1) ON
13	MOVL V=100
14	MOVL V=50

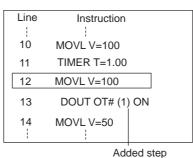

Added step

# Spot and Arc Welding Using Motor Gun

8 Parameter

8.3 Mode Operation Setting Parameters

Fig. 8-5: S2C206-1 (Be	tween Instructions)
------------------------	---------------------

# 8.3.0.9 S2C207: MASTER JOB CHANGING OPERATION

This parameter specifies whether to permit or prohibit master job changing operation. If "PROHIBIT" is specified, the master job cannot be changed (or registered) easily. The specification can be done on the OPERATING CONDITION window.

- 0 : Permitted
- 1 : Prohibited

#### 8.3.0.10 S2C208: CHECK AND MACHINE-LOCK KEY OPERATION IN PLAY MODE

This parameter specifies whether to permit or prohibit in play mode to change the operation that changes the operation condition. Even if an error occurs because of the operation with the keys, the manipulator does not stop. The specification can be done on the OPERATING CONDITION window.

- 0 : Permitted
- 1 : Prohibited

#### 8.3.0.11 S2C209: RESERVED WORK JOB CHANGING OPERATION

This parameter specifies whether to permit reserved work job changing operation.

The designation can be done on the OPERATING CONDITION window.

- 0 : Permitted
- 1 : Prohibited

#### 8.3.0.12 S2C210: MASTER OR SUBMASTER CALL OPERATION IN PLAY MODE

This parameter specifies whether the master or submaster call operation in play mode is permitted or not. When the independent control function is valid, the master job for sub-task is specified at the same time. The specification can be done on the OPERATING CONDITION window.

- 0 : Permitted
- 1 : Prohibited

8 Parameter

#### 8.3.0.13 S2C211: LANGUAGE LEVEL

This parameter specifies the level of the robot language (INFORM III). The levels simplify the instruction registering operation. With the DX100, all robot instructions can be executed regardless of specification of instruction sets. The specification can be done on the TEACHING CONDITION window.

#### 0: Contracted Level

Only frequently used robot instructions are selected to reduce the number of instructions to be registered. Robot instructions displayed on the instruction dialog box are also reduced so that specification is simplified.

#### 1: Standard Level

2: Expanded Level

All the robot instructions are available in standard and expanded levels. The two levels are distinguished by the number of additional information items (tags) that can be used with robot instructions. At the expanded level, the flowing functions are available.

- Local Variables and Array Variables
- Use of Variables for Tags (Example: MOVJ VJ=I000) The above functions are not available at the standard level, however, which reduces the number of data required to register instructions, thereby simplifying the operation.

#### 8.3.0.14 S2C214: INSTRUCTION INPUT LEARNING FUNCTION

This parameter specifies whether to set a line of instructions that has been input on the input buffer line when pressing the first soft key for each instruction. If "PROVIDED" is selected, the instructions are set.

- 0 : Without learning function
- 1 : With learning function

#### 8.3.0.15 S2C215: ADDRESS SETTING WHEN CONTROL POWER IS TURNED ON

This parameter specifies the processing of the job name, step No., and line No. that are set when the control power supply is turned ON.

- 0 : Reproduces the address when power supply is turned ON.
- 1 : Lead address (Line"0") of the master job.

#### 8.3.0.16 S2C216: JOB LIST DISPLAY METHOD AT JOB SELECTION

These parameters specify the displaying method on the JOB LIST window at job selection.

- 0 : Order of Names
- 1 : Order of Date

RE-CSO-A044

<sup>163543-1CD</sup> Spot and Arc Welding Using Motor Gun		<ul><li>8 Parameter</li><li>8.3 Mode Operation Setting Parameters</li></ul>	
8.3.0.17 S2C217: INITIAL		OPERATION OF MANIPULATOR	
		This parameter specifies the operation speed level of the first section when starting. Specify the operation speed with the low-speed start (S1CxG044). When starting at low-speed, the manipulator stops after reaching the indicated step regardless of the cycle setting. Once the manipulator is paused during the low-speed operation, it moves at teaching speed when restarted.	
		<ul> <li>Specified on the SPECIAL PLAY window. Operates at low speed only when low speed start is set. Operates at taught speed when not instructed.</li> </ul>	
		1 : Starts at low speed after editing regardless of soft key instructions.	

# 8.3.0.18 S2C218: PLAYBACK EXECUTION AT CYCLE MODE "1- STEP"

Parameter Setting Value		O	peration Units
0	MOVL DOUT TIMER DOUT MOVL		Stops at every instruction
1	MOVL DOUT TIMER DOUT MOVL		Stops at move instruction

When operating "FORWARD" by the programming pendant, the units for execution are set in another parameter (S2C198).

# 8.3.0.19 S2C219: EXTERNAL START

This parameter specifies whether a start instruction from external input is accepted or not. The specification can be done on the OPERATING CONDITION window.

- 0 : Permitted
- 1 : Prohibited

# 8.3.0.20 S2C220: PROGRAMMING PENDANT START

This parameter specifies whether a start instruction from the programming pendant is accepted or not.

- 0 : Permitted
- 1 : Prohibited

		163543-1CD
Spot and Arc Welding Using Motor Gun		<ul><li>8 Parameter</li><li>8.3 Mode Operation Setting Parameters</li></ul>
8.3.0.21	S2C221: SPEED	DATA INPUT FORM
		This parameter specifies the units for speed data input and display.
		mm/s : in units of 0.1 mm/s
		cm/min : in units of 1 cm/min
		inch/min : in units of 1 inch/min
		mm/min : in units of 1 mm/min
		The specification can be done on the OPERATING CONDITION window.
		0 : mm/sec
		1 : cm/min
		2 : inch/min
		3 : mm/min
8.3.0.22	S2C222: RESER	RVED START
		This parameter specifies whether a reserved start instruction from the programming pendant is accepted or not. The specification can be done on the OPERATING CONDITION window.
		0 : Permitted

1 : Prohibited

### 8.3.0.23 S2C224: JOB SELECTION AT REMOTE FUNCTION (PLAY MODE)

This parameter specifies whether a job selection in play mode at remote function is prohibited or not.

- 0 : Permitted
- 1 : Prohibited

# 8.3.0.24 S2C225: EXTERNAL MODE SWITCH

This parameter specifies whether mode switching from the outside is accepted or not. The specification can be done on the OPERATING CONDITION window.

- 0 : Permitted
- 1 : Prohibited

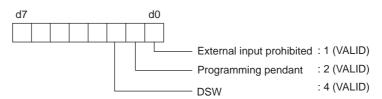

# 8.3.0.25 S2C227: EXTERNAL CYCLE SWITCHING

This parameter specifies whether cycle switching from the outside is accepted or not. The specification can be done on the OPERATING CONDITION window.

- 0 : Permitted
- 1 : Prohibited

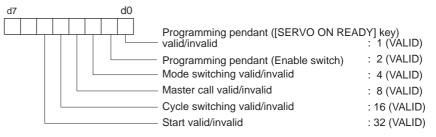

<sup>163543-1CD</sup> Spot and Arc Welding Using Motor Gun		<ul><li>8 Parameter</li><li>8.3 Mode Operation Setting Parameters</li></ul>	
8.3.0.26	S2C228: PROG	RAMMING PENDANT CYCLE SWITCHING	
		This parameter specifies whether cycle switching from the programming pendant is accepted or not. The specification can be done on the OPERATING CONDITION window.	
		0 : Permitted 1 : Prohibited	
8.3.0.27	S2C229: SERV0	O ON FROM EXTERNAL PP PROHIBITION	

This parameter specifies whether a servo ON instruction is accepted or not. More than one instruction can be specified. For example, to permit the servo ON instruction from an external input only, set "2". In this case, servo ON instruction from the programming pendant is not accepted. The specification can be done on the OPERATING CONDITION window.

# 8.3.0.28 S2C230: PROGRAMMING PENDANT OPERATION WHEN "IO" IS SELECTED FOR REMOTE MODE

This parameter specifies whether each operation of the following is valid when "IO" is selected for remote function selection. IO and command are available for remote function selection: "IO" is set prior to shipping. "Command" is valid when transmission function (optional) is specified.

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

### 8.3.0.29 S2C234: STEP REGISTRATION AT TOOL NO. CHANGE

The registration of the step when the tool number is changed allows the setting to be made as prohibited.

If this parameter is set to "1" (prohibited), the following operations are prohibited.

- 0 : Permitted
- 1 : Prohibited
  - Modification of a step When the tool number of the teaching step differs from the currentlyselected tool number, the step cannot be modified.
  - Deletion of a step Even if the teaching step position coincides with the current position, the step cannot be deleted when the tool number of the teaching step differs from the currently-selected tool number.
  - Addition of a step When the tool number of the teaching step indicated by the cursor differs from the currently-selected tool number, the step cannot be added.

### 8.3.0.30 S2C293: REMOTE FIRST CYCLE MODE

This parameter sets the cycle that changes from the local mode to the remote mode.

The setting can be made on the OPERATING CONDITION window.

- 0 : Step
- 1 : 1 cycle
- 2 : Continuous
- 3 : Setting retained

#### 8.3.0.31 S2C294: LOCAL FIRST CYCLE MODE

This parameter sets the cycle that changes from the remote mode to the local mode.

The setting can be made on the OPERATING CONDITION window.

- 0 : Step
- 1 : 1 cycle
- 2 : Continuous
- 3 : Setting retained

#### 8.3.0.32 S2C312: POWER ON FIRST CYCLE MODE

This parameter sets the first cycle mode for when the power is turned ON.

The setting can be made on the OPERATING CONDITION window.

- 0 : Step
- 1 : 1 cycle
- 2 : Continuous
- 3 : Setting retained

163543-1CD Spot and Arc Welding Using Motor Gun		<ul><li>8 Parameter</li><li>8.3 Mode Operation Setting Parameters</li></ul>	
8.3.0.33	S2C313: TEACH	MODE FIRST CYCLE MODE	
		This parameter sets the cycle that changes from the play mode to the teach mode.	
		The setting can be made on the OPERATING CONDITION window.	
		0 : Step	
		1 : 1 cycle	
		2 : Continuous	
		3 : Setting retained	
8.3.0.34	S2C314: PLAY N	4: PLAY MODE FIRST CYCLE MODE	
		This parameter sets the cycle that changes from the teach mode to the play mode.	
		The setting can be made on the OPERATING CONDITION window.	
		0 : Step	
		1 : 1 cycle	
		2 : Continuous	
		3 : Setting retained	
8.3.0.35	S2C316: START	CONDITION AFTER ALARM-4107 ("OUT OF RANGE (ABSO DATA)")	
		This parameter specifies the activating method after the alarm 4107 ("OUT OF RANGE (ABSO DATA)") occurs.	

- 0 : Position check operation required
- 1 : Low-speed start up

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

#### 8.3.0.36 S2C395: SIGNAL NAME ALIAS FUNCTION

On the JOB CONTENT window, the name registered to the user input/ output signal number can be displayed as alias instead of the signal number itself.

Table 8-4: S2C395

Parameter Setting Value	Valid/Invalid
0	Function invalid
1	Function valid

- With this function valid, the confirmation dialog box "Register by name (alias)?" is displayed when a signal (IN#(), OT#(), IG#(), OG#(), IGH#(), OGH#()) is selected on the DETAIL EDIT window.
- Select "YES" and the signal select window appears. Then select the target signal of number and press [ENTER], and the registered name is displayed instead of the signal number. However, if the signal number's name is not yet registered, it is displayed by number as usual.

<**Example**> Registration of the name of user output OUT#0001 as "OUTPUT 1"

In the case of DOUT instruction:

S2C395=0 : DOUT OT#(1) ON

S2C395=1 : DOUT OT#(OUTPUT 1) ON

Select {IN/OUT}  $\rightarrow$  {UNIVERSAL INPUT/OUTPUT} to edit signal names on the window. Up to 16 characters can be entered as a signal name. However, when this function is valid, if the content below is entered, the error message shows and the name cannot be registered.

- The name already registered
- Letters beginning with a number
- Letters including the signs below:
  - ( , ) , [ , ] , = , < , > , space, comma
- Letters beginning with "alphabets representing variables" + "number"
- SUPPLE
- <Example> B0..., I0..., BP1..., LEX2...

Alphabets representing variables: B, I, D, R, S, P, BP, EX, PX, LB, LI LD, LR, LS, LP, LBP, LEX, LPX

When the name begins with "'", it is regarded as a comment and the same comment can be registered for two or more signals. In this case, although this function is valid, the number is displayed on the JOB CONTENT window instead of the name.

<Example> Registration of the name of user output OUT#0002 as " 'OUTPUT 2" S2C395=0 : DOUT OT#(2) ON S2C395=1 : DOUT OT#(2) ON

# Spot and Arc Welding Using Motor Gun

g 8 Parameter

8.3 Mode Operation Setting Parameters

# 8.3.0.37 S2C396: VARIABLE NAME ALIAS FUNCTION

On the JOB CONTENT window, the name registered to the variable (including local variables) can be displayed as alias instead of the variable number.

Table 8-5: S2C396

Parameter Setting Value	Valid/Invalid
0	Function invalid
1	Function valid

- With this function valid, the confirmation dialog box "Register by name (alias) ?" is displayed when you select the variable on the DETAIL EDIT window.
- 2. Select "YES" and the variable select window appears. Then select the target variable of number and press [ENTER], and the registered name is displayed instead of the variable number. However, if the variable number's name is not yet registered, it is displayed by number as usual.

<Example> Registration of the byte type variable B000 as "WORK KIND" In the case of SET instruction S2C396=0 : SET B000 128

S2C396=1 : SET WORK KIND 128

Select {VARIABLE} from the menu to select each variable and edit the variable name. Up to 16 characters can be entered as a variable name. However, when this function is valid, if the content below is entered, the error message shows and the name cannot be registered.

- The name already registered
- Letters beginning with a number
- Letters including the signs below: (,),[,],=,<,>, space, comma
- Letters beginning with "alphabets representing variables" + "number"

**Example>** B0..., I0..., BP1..., LEX2... Alphabets representing variables: B, I, D, R, S, P, BP, EX, PX, LB, LI LD, LR, LS, LP, LBP, LEX, LPX

When the name begins with "'", it is regarded as a comment and the same comment can be registered for two or more variables. In this case, although this function is valid, the number is displayed on the JOB CONTENT window instead of the name.

<**Example>** Registration of the byte type variable B001 as "WORKNUM" S2C396=0 : SET B001 10

S2C396=1 : SET B001 10

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

### 8.3.0.38 S2C397: I/O VARIABLE CUSTOMIZE FUNCTION

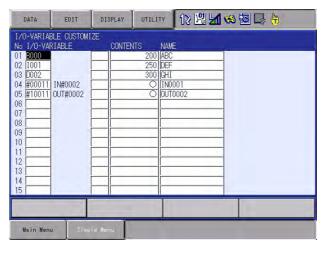

This function enables registration of any particular input/output signal/ variable. Reference and editing of signals/variables are possible on the same window.

Table 8-6: S2C397

Parameter Setting Value	Valid/Invalid
0	Function Invalid
1	Function Valid

With this function valid, the sub-menu {I/O-VARIABLE CUSTOMIZE} opens under the main menu {ARC WELDING}, {SPOT WELDING}, {GENERAL}, {HANDLING} (differs by application). Select {I/O-VARIABLE CUSTOMIZE}, and the I/O-VARIABLE CUSTOMIZE window appears as follows.

On the I/O-VARIABLE CUSTOMIZE window, any of the input/output signals/variables can be selected and registered (up to 32 items). Registrable signals/variables are as follows:

Input/Output Signals	USER INPUT SIGNAL USER OUTPUT SIGNAL PSEUDO INPUT SIGNAL
Variables	BYTE TYPE VARIABLE (B VARIABLE) INTEGER TYPE VARIABLE (I VARIABLE) DOUBLE-PRECISION INTEGER TYPE VARIABLE (D VARIABLE)

The contents and names of the registered signals/variables can be checked and edited on this window.

In addition, the data list of registered signals/variables can be loaded, saved, verified or deleted with an external memory unit.

Only when this function is valid, "I/O-VARIABLE CUSTOMIZE (file name: USRIOVAR.DAT)" is displayed and can be selected. To display the "I/O-VARIABLE CUSTOMIZE (file name: USRIOVAR.DAT)", select {FD/CF}  $\rightarrow$  {LOAD} {SAVE} {VERIFY} {DELETE}  $\rightarrow$  {SYSTEM DATA}.

On this window, the following operations are available with the same operations as job list window.

- Batch selection / canceling selection of the jobs
   ({EDIT} →{SELECT ALL} →{CANCEL SELECT})
- Job search ({EDIT} →{JOB SEARCH COND} )
- Rearrange of the jobs in the order of date / order of name ( {DISPLAY} →{DATE} {NAME})
- Job detailed information display ( {DISPLAY} → {DETAIL} )

#### Restoring the Job

Choose a job to be restored and select {UNDELETE JOB} from {JOB} on the pull down menu.

A dialog box to confirm restoring the selected job.

Undel	ete?
TEST01	
YES	NO

Select

[YES] to restore the job. The restored job is deleted from the trash job list and newly listed to the job list.

[NO} to cancel restoring the job.

# Spot and Arc Welding Using Motor Gun

8 Parameter

8.3 Mode Operation Setting Parameters

# **Deleting the Job Completely**

Delete a job from the memory. The job will not be restored after this operation.

Choose a job to be completely deleted, then select {DELETE JOB} from {JOB} on the pull down menu.

A dialog box to confirm deleting the selected job.

	Delete?
TEST01	
YES	NO

Select

[YES] to delete the job completely. The deleted job is deleted from the trash job list.

[NO} to cancel deleting the job.

The job data remains until it is completely deleted and the capacity of the memory becomes less as long as this function is valid. Delete unnecessary data to keep enough job capacity.

# 8.3.0.41 S2C415 to S2C419: TIME RESET

These parameters specify whether resetting operation of the specified times is permitted or not.

- S2C415 : CONTROL POWER ON TIME
- S2C416 : SERVO POWER ON TIME
- S2C417 : PLAYBACK TIME
- S2C418 : WORK TIME
- S2C419 : WEAVING TIME
- 0 : Prohibit Resetting
- 1 : Permit Resetting

"PERMIT" is set as the initial value for the work time and motion time.

Spot and Arc Welding Using Motor Gun

- 8 Parameter
  - 8.3 Mode Operation Setting Parameters

#### 8.3.0.42 S2C431: TOOL NO. SWITCHING

This parameter specifies whether tool number switching is permitted or not.

- 0 : Prohibited (Only number "0" can be used.)
- 1 : Permitted (64 type of tools from number "0" to "63" can be used.)

#### 8.3.0.43 S2C433: POSITION TEACHING BUZZER

This parameter specifies whether the buzzer sound at position teaching is used or not.

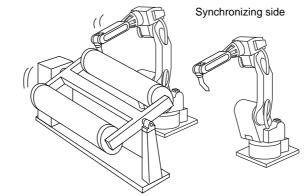

- 0 : With buzzer
- 1 : Without buzzer

#### 8.3.0.44 S2C434: JOB LINKING DESIGNATION (When Twin Synchronous Function Used)

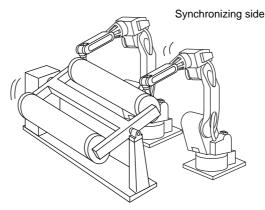

This parameter specifies whether the manipulator at the synchronizing side is to be linked when the manipulator and the station at the synchronized side are performing FWD/BWD or test run, by using the twin synchronous function.

- 0 : Not operating
- 1 : Linking

# Spot and Arc Welding Using Motor Gun

g 8 Parameter

8.3 Mode Operation Setting Parameters

# 8.3.0.45 S2C437: PLAYBACK OPERATION CONTINUATION FUNCTION

This function is used to decide where to resume the playback on the start operation after suspending the playback and moving the cursor or selecting other jobs.

- 0: Starts operation where the cursor is located in the job displayed at the moment.
- 1: The playback continuation window appears. Select "YES" and the playback resumes where the cursor has been located when the playback suspended. If "NO" is selected, the playback resumes where the cursor is located in the job displayed at the moment.

Parameter Setting Value	Where the Playback Resumes		
0	Resumes where the cursor is located in the job displayed at the moment.		
1	Resumes where the cursor has been located when the playback suspended OR where the cursor is located in the job displayed at the moment. < <b>Example&gt;</b> Suspended at step 0003 during the playback of job A ↓ Displays job B ↓ Starts operation ↓ On the playback operation continuation window • When "YES" selected, the playback resumes from step 0003 of job A • When "NO" selected, the playback resumes from the current position in job B		

\* When this function is valid (S2C437=1), a light blue cursor is displayed at the instruction section of step where the playback has been stopped. When "YES" is selected, the playback resumes where this cursor is located.

JOB	EDIT	DISPLAY	UTILITY	12 😕 📶 👒 🙋 🕞 🙌
JOB CONTE J:TEST CONTROL G			S:000 TOOL:

MOVJ VJ:	0.78			
Main Men	u Simp	le Menu		

If a job has been edited or FWD/BWD/TEST RUN operation(s) have been executed, the playback cannot resume where it has suspended. Also this function is invalid if the reserved start function is set valid (S2C222=0). Spot and Arc Welding Using Motor Gun

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

8.3.0.46 S2C544: I/O NAME DISPLAY FUNCTION FOR JOB

When a user input/output signal, whose name is already set, is used as a job, this function displays the signal name in the form of a comment.

JOB CONTENT: MASTER
J:SAMPLE01
CONTROL GROUP: R1
0000 NOP
0001 DOUT OT#(1) ON //OUTPUT01
0002 MOVJ VJ=0.78
0003 WAIT IN#(1)=ON //INPUT01
0004 MOVJ VJ=0.78
0005 END

When the specification of the signal is group specification (IG#, IGH#, OG#, OGH#), the name will not be displayed. Also, the name will not be displayed when the job is saved at external memory devices.

This parameter can be set on {FUNCTION ENABLE}.window.

- 0 : Invalid
- 1 : Valid

### 8.3.0.47 S2C684:ALL AXES ANGLE DISPLAY FUNCTION

This function enables to change the display of manipulator position from pulse-formed to angle-formed on the specific window.

This function is valid in the following windows.

- Current value (however, it is invalid if the present displayed coordinate systems are "base", "robot" or "user".)
- Command position
- Work home position
- Second work home position

d7	d0	
	Function Valid/Invalid Cordinated sytem Pulse/Angle Data system when angle is specified Absolute/Ground	:1:(Valid) :2(Angle) :4(Ground)

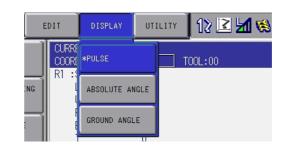

This function can be valid/invalid on {FUNCTION ENABLE} window.

Spot and Arc Welding Using Motor Gun

8 Parameter

8.3 Mode Operation Setting Parameters

Select {DISPLAY} on the pull down menu while this function is valid, then {PUSLE}, {ABSOLUTE ANGLE} and {GROUND ANGLE} appear. Select one so that the presently displayed data can be changed to the selected data type.

# PULSE

Indicates the pulse data of each axis.

CURRENT POS COORDINATE [	
R1 :S	0
L	0
U	0
R	.0
В	0
Т	.0

# **ABSOLUTE ANGLE**

Indicates the independent angle at every axes on the basis that the absolute value is 0[deg] when the pulse is 0.

CURRENT POSITION COORDINATE ABSO.ANGLE		
R1 :S	0.0000 deg.	
L	0.0000 deg.	
U	0.0000 deg.	
R	0.0000 deg.	
В	0.0000 deg.	
Т	0.0000 deg.	

### **GROUND ANGLE**

Indicates the L- and U-axes angle according to the manipulator installation direction. The value of unoperated axes may vary depending on the manipulator's posture.

CURRENT PO COORDINATE	DSITION E GND.ANGLE
R1 :S	0.0000 deg.
L	90.0000 deg.
U	0.0000 deg.
R	0.0000 deg.
В	0.0000 deg.
T	0.0000 deg.

As for the servo track, angle is not indicated but distance (unit [mm]).

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

# 8.3.0.48 S2C713: CONTROL POINT OPERATION SETTING ON THE SERVO TRACK

This parameter specifies a motion system by which the manipulator's control point is fixed while the servo track is in operation.

However, it is valid only when the selected control group is specified as a servo track and the servo track is operated by jog keys in the cartesian coordinates.

- 0 : Normal operation
- 1 : Control point operation setting on the servo track

### Soft Limit

Soft limit is a software-type function to limit the range of movement of the manipulator.

If the TCP reaches the soft limit during operation, the manipulator automatically stops and no longer moves in that same direction. An alarm occurs if this soft limit is exceeded during playback. This soft limit is classified into two types.

• Cube Soft Limit Soft limit is set with the absolute value on the base coordinates.

Refer to Section 8.4.0.1 "S1CxG400 to S1CxG415: PULSE SOFT LIMIT" on page 8-32.

	Checking Method Designation	Servo Power Supply ON	Servo Power Supply OFF	
	Command	Command	Feedback	
	Feedback	Feedback	Feedback	
	During the servo float function operation, checking is performed by feedback regardless of the checking method designation.			

# Spot and Arc Welding Using Motor Gun

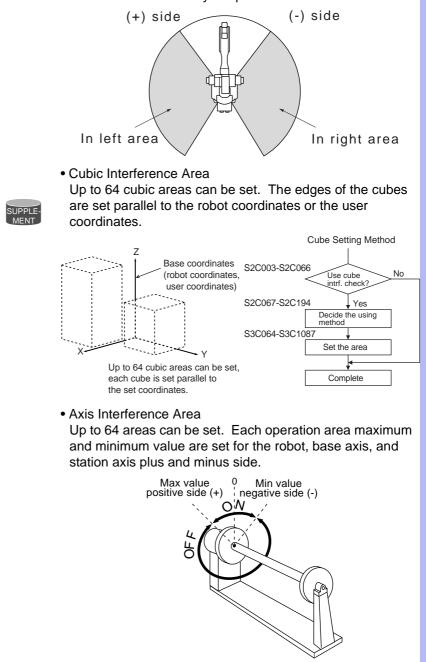

8 Parameter

#### 8.4 Parameters According to Interference Area

#### **Interference Area**

It is possible to output whether the TCP during operation is inside or outside as a status signal, and to set the area to control the position by parameters S2C003 to S2C194. When the manipulator attempts to enter this area, the corresponding input signal (e.g. an "entrance prohibit signal") is detected. The manipulator stops immediately if there is an input signal and goes into waiting status until this signal is cleared. This signal is processed in the I/O section. Three methods of interference area settings are prepared for manipulators and stations. For a system with one manipulator, use robot 1.

• S-axis Interference Area Position is controlled by the pulse value of the S-axis.

- 8 Parameter
- 8.4 Parameters According to Interference Area

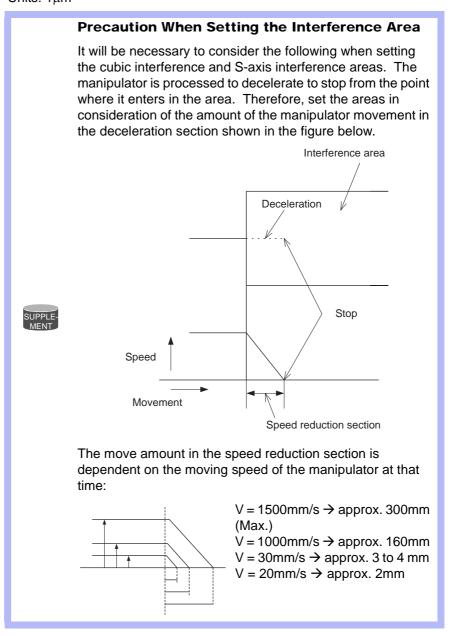

### 8.4.0.5 S2C067 to S2C194: CUBE USING METHOD

These parameters specify the coordinates for defining the cube. If the user coordinates are selected, also specify the user coordinate system numbers. Set cubic area referring to the cubic interference areas shown below.

Coordinate specification

- 0 : Pulse (axis interference)
- 1 : Base coordinates
- 2 : Robot coordinates
- 3 : User coordinates

Coordinate No.: Specify the user coordinate number when selecting "3: User Coordinates". Units:  $1\mu m$

8.4 Parameters According to Interference Area

#### 8.4.0.6 S3C000 to S3C047: CUBE SOFT LIMIT

These parameters specify auxiliary functions of S2C001 parameter. For details, see Section 8.4.0.2 "S2C001: CUBE SOFT LIMIT CHECK" on page 8-32.

#### 8.4.0.7 S3C048 to S3C063: S-AXIS INTERFERENCE AREA

These parameters specify auxiliary functions of S2C002 parameter. For details, see Section 8.4.0.3 "S2C002: S-AXIS INTERFERENCE CHECK" on page 8-34.

#### 8.4.0.8 S3C064 to S3C1087: CUBIC INTERFERENCE AREA

These parameters specify auxiliary functions of S2C003 to S2C066 parameters. For details, see Section 8.4.0.4 "S2C003 to S2C066: CUBE/ AXIS INTERFERENCE CHECK" on page 8-35.

#### 8.4.0.9 S3C1089 to S3C1096: ROBOT INTERFERENCE AREA

These parameters specify auxiliary functions of S2C236 to S2C263 parameters. For details, see *Section 8.4.0.6 "S3C000 to S3C047: CUBE SOFT LIMIT" on page 8-39.* 

#### 8.4.0.10 S3C1097: A SIDE LENGTH OF WORK-HOME-POSITION CUBE

Units: 1µm

This parameter specifies a side length of the cube for the work home position.

# Spot and Arc Welding Using Motor Gun

8 Parameter

8.5 Parameters according to Status I/O

# 8.5 Parameters according to Status I/O

These parameters set the parity check or I/O setting for user input/output signals.

# 8.5.0.1 S2C235: USER OUTPUT RELAY WHEN CONTROL POWER IS ON

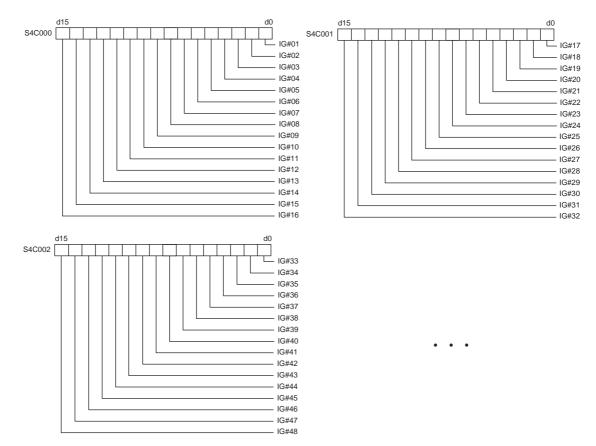

This parameter specifies the state of the user output relays when the control power is turned ON. Since the power OFF state, including peripheral devices, cannot be completely reproduced, take note when restarting.

- 0 : Reset to the power OFF state
- 1 : Initialized (all user relays OFF)

### 8.5.0.2 S4C000 to S4C015: PARITY OF USER INPUT GROUPS

These parameters specify whether to execute priority checks with parameters when instructions covering the input group (1G#) are executed. The instructions covering the input groups are as shown below.

- IF Sentence (JUMP, CALL, RET, PAUSE)
- Pattern Jump, Pattern Job Call
- DIN
- WAIT

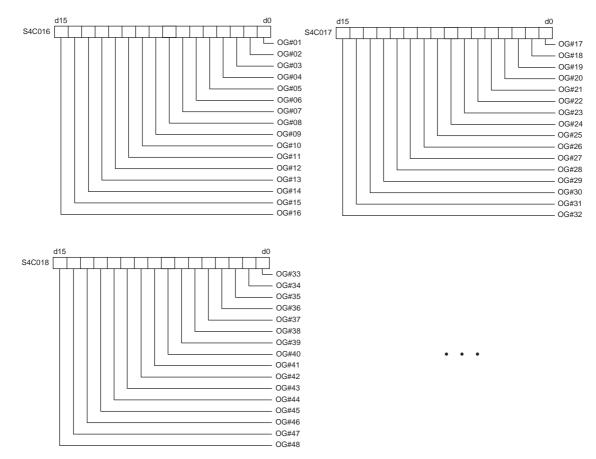

Parity bits are set as the highest level bits of each input group and are written in even parity. If an error is detected during parity check, an alarm occurs and the manipulator stops. Remains unchanged if no parity check is specified.

- 8 Parameter
- 8.5 Parameters according to Status I/O

#### 8.5.0.3 S4C016 to S4C031: PARITY OF USER OUTPUT GROUPS

These parameters specify whether the output group instruction is executed with parity check (even parity).

Parity bits are set as the highest level bits of each output group. For example, if OG#01 is specified with parity and DOUT OG# (1) 2 is executed, the result will be 00000010 if 2 is binary converted. Since there will be only one bit (odd) ON at this time, the parity bit (highest level bit) will be set to ON and 10000010 (130) will be output to OG# (1).

As in the case of a variable such as DOUT OG# (1) B003 parity bits are added to the contents of the variable data. However, if the contents of the variable exceed 127, as in the case of DOUT OG# (1) 128, an alarm will occur. Remains unchanged if no parity check is specified.

8.5 Parameters according to Status I/O

# 8.5.0.6 S4C064 to S4C079: USER OUTPUT GROUP TO BE INITIALIZED AT SWITCHING MODE

Set the user output group with bit to be initialized at switching mode. Use these parameters when using user output signals as work instructions for peripheral devices.

# 8.5.0.7 S4C240: USER OUTPUT NO. WHEN MANIPULATOR DROP ALLOWABLE RANGE ERROR OCCURS

This parameter specifies the user output number to output the manipulator drop allowable range error alarm occurrence externally.

When this function is not used, set "0".

Spot and Arc Welding Using Motor Gun

- 8 Parameter
- 8.6 Parameters according to Coordinated or Synchronized Operation

# 8.6 Parameters according to Coordinated or Synchronized Operation

These parameters make the settings for coordinated or synchronized operations between manipulators or between manipulators and stations.

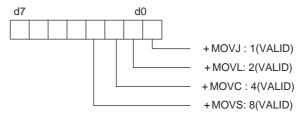

### 8.6.0.1 S2C212: +MOV or +SMOV INSTRUCTION SPEED INPUT

This parameter specifies whether the speed inputting for move instructions of the master robot in a coordinated job is permitted or not.

<example> 0: Not Provided</example>		
SMOVL	V=100	
+MOVL		← Master side Speed specification not provided
<example> 1: Provided</example>		
SMOV L	V=100	
+MOV L	V=100	$\leftarrow$ Master side
		Speed specification provided

#### 8.6.0.2 S2C213: +MOV INSTRUCTION INTERPOLATION INPUT

This parameter specifies which interpolation is permitted for move instructions for the master robot in a coordinated job. More than one instruction can be specified.

# 8.6.0.3 S2C231: OPERATION METHOD AT FWD/BWD OPERATION OR TEST RUN BY INDEPENDENT CONTROL

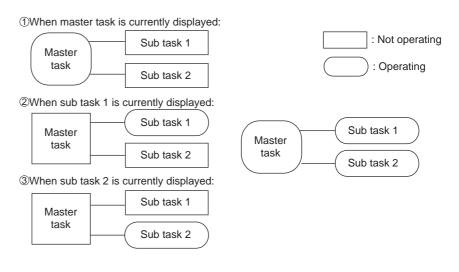

This parameter specifies the operation method at FWD/BWD operation or test run by independent control.

- 0 : The job of the task that is currently displayed operates.
- 1 : Jobs of all the tasks operate.

# Spot and Arc Welding Using Motor Gun

#### 8 Parameter

8.6 Parameters according to Coordinated or Synchronized Operation

0: One of the task jobs that are currently 1: All task jobs operate. displayed operates.

#### 8.6.0.4 S2C232: JOB AT CALLING MASTER OF SUBTASK BY INDEPENDENT CONTROL

This parameter specifies the job which is called up when the master of the subtask is called up by independent control.

- 0 : Master job
- 1 : Root job

Master Job: Job registered in the master control window

Root Job: Job activated by PSTART instruction

#### 8.6.0.5 S2C264: STATION AXIS CURRENT VALUE DISPLAY FUNCTION

This parameter specifies whether the function to display the current value of the station axis in the following units is valid/invalid.

- 0 : Invalid
- 1 : Valid

Rotary axis : Angle (deg) Servo track : Distance (mm)

Regarding whether to specify the rotary axis or the servo track, refer to Section 8.6.0.6 "S2C265 to S2C288: STATION AXIS DISPLAYED UNIT".

#### 8.6.0.6 S2C265 to S2C288: STATION AXIS DISPLAYED UNIT

This parameter specifies the station axis displayed unit (bit specification).

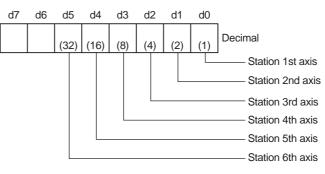

- 0 : Display angle (deg)
- 1 : Display in distance (mm)

# Spot and Arc Welding Using Motor Gun

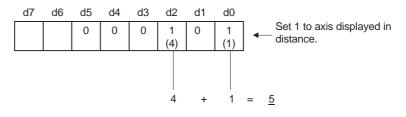

- 8 Parameter
- 8.6 Parameters according to Coordinated or Synchronized Operation

#### Setting Method

Set a numerical value (decimal) where the bit of the axis to be displayed in the units of distance becomes 1.

<**Example>** When 1st and 3rd axes of station 1 are displayed in the units of distance:

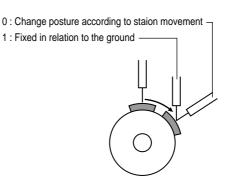

Therefore, set parameter S2C265 of station 1 to 5.

8.6.0.7 S2C420: POSTURE CONTROL OF SYNCHRONIZED MANIPULATOR (When Twin Synchronous Function Used)

This parameter specifies the posture control method for synchronized manipulator performing compensation during playback by using the twin synchronous function.

- 0 : Change posture according to station movement
- 1 : Fixed in relation to the ground

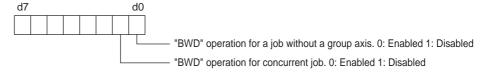

# 8.6.0.8 S2C421: POSTURE CONTROL OF MANIPULATOR IN MULTI-JOB (When Twin Synchronous Function Used)

This parameter specifies the posture control method for manipulator executing compensation at the linking side when job linking is performed during FWD/BWD operation by the twin synchronous function.

- 0 : Change posture according to station movement
- 1 : Fixed in relation to the ground

163543-1CD		
Spot and Arc Welding Using Motor Gun	<ul> <li>8 Parameter</li> <li>8.6 Parameters according to Coordinated or Synchronized Operation</li> </ul>	
8.6.0.9 S2C687: OPERA	TION OF JOB WITHOUT CONTROL GROUP SPECIFICATION	
	When the servo power supply is individually turned OFF where jobs in multiple number of tasks are operated using the independent control function, the job execution of the control group whose servo power supply is turned OFF is interrupted. The jobs of other control groups continue their execution.	
	For the jobs without control group specification such as master job, the conditions for execution can be set by the parameter.	
	<ol> <li>Execution possible only when servo power supply to all the axes have been turned ON.</li> </ol>	
	1 : Execution possible when servo power supply to any axis is turned ON.	
8.6.0.10 S2C688: EXECU	JTION OF "BWD" OPERATION	
	This parameter prohibits step-back operation of a job without a step.	

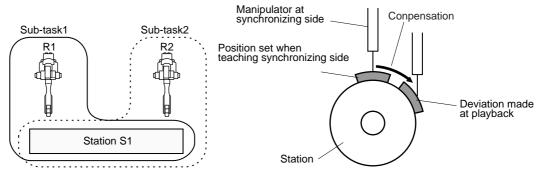

8.6.0.11 S3C1101: MAXIMUM DEVIATION ANGLE OF CURRENT STATION POSITION (When Twin Synchronous Function Used)

Used when the twin synchronous function is used. This parameter specifies the maximum deviation between the teaching position and the current station position.

0 : No deviation check

Other than 0 : Deviation angle (units : 0.1°)

In the above figure on the left, the follower R2 executes the job of subtask 2 in synchronization with the motion of the station axis which is moved by the R1 job. In this procedure, the job of subtask 2 controls only the R2 robot axis.

If the teaching position of the station in the subtask 2 differs from the station current position (controlled by the subtask 1 job), the difference is automatically offset so that R2 keeps the taught position in relation to the station.

Difference between the taught and the station current positions is always monitored. If the difference exceeds a set value of the parameter, the message "PULSE LIMIT (TWIN COORDINATED)" appears.

8.7 Parameters for Other Functions or Applications

## 8.7 Parameters for Other Functions or Applications

These parameters make the settings for other functions or applications.

#### 8.7.0.1 S1CxG049 to S1CxG051: SMALL CIRCLE CUTTING

These parameters prescribe cutting operation at small circle cutting.

S1CxG049 (Minimum diameter)	:	Set the minimum diameter of a figure in the units of $\mu$ m that can be processed by small-circle cutting machine.
S1CxG050 (Maximum diameter)	:	Set the maximum diameter of a figure in the units of $\mu m$ that can be processed by small-circle cutting machine.
S1CxG051 (Maximum speed)	:	Set the maximum cutting speed at operation by CUT instruction in the units of 0.1mm/s.

#### 8.7.0.2 S1CxG052 to S1CxG053: SMALL CIRCLE CUTTING DIRECTION LIMIT VALUE

These parameters set the cutting direction limits at small circle cutting.

S1CxG052 (+ direction)	:	Set the limit value in the positive direction of cutting angle DIR set by CUT instruction, in the units of 0.01°.
S1CxG053 (- direction)	:	Set the limit value in the negative direction of cutting angle DIR set by CUT instruction, in the units of 0.01°.

#### 8.7.0.3 S1CxG054 to S1CxG055: SMALL CIRCLE CUTTING OVERLAP VALUE

These parameters set the overlapped value at small circle cutting.

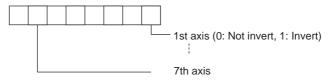

S1CxG054 (Operation radius)	:	Set the operation radius at inner rotation in the units of 1 $\mu m$ after overlapping by CUT instruction.
S1CxG055 (Rotation angle)	:	Set the rotation angle at inner rotation in the units of $0.1^{\circ}$ after overlapping by CUT instruction.

## 8.7.0.4 S1CxG063, S1CxG064: PATTERN CUTTING DIMENSION

These parameters set the minimum diameter (S1CxG063) and the maximum diameter (S1CxG064) for the pattern cutting in units of  $\mu$ m.

#### 8.7.0.5 S1CxG065: MIRROR SHIFT SIGN INVERSION

This parameter sets which axis to be shifted (mirror-shift: invert the sign).

## 8.7.0.6 S2C430: RELATIVE JOB OPERATION METHOD

This parameter specifies how to operate a relative job. A method to convert a relative job into a standard job (pulse), and a conversion method to calculate the aimed position (pulse position) when a relative job is operated can be specified.

- 0 : Previous step with priority (B-axis moving distance minimized.)
- 1 : Form with priority
- 2 Previous step with priority (R-axis moving distance minimized.)

163543-1CD         Spot and Arc Welding         Using Motor Gun         8.7 Parameters for Other Functions or Applications         8.7.0.7         S3C1111 to S3C1190: ANALOG OUTPUT FILTER CONSTANT (When analog output corresponding to speed function is used)			
		By setting a constant to filter, a filter processing can be performed for the output analog signal.	
8.7.0.8	S3C1191: CUT W	IDTH CORRECTION VALUE (When form cutting function is used)	
		This parameter specifies the path correction value for pattern cutting operation. A value 1/2 of the cut width is set in units of $\mu$ m.	

## 8.8 Hardware Control Parameters

These parameters make the hardware settings for fan alarm or relay operation, etc.

### 8.8.0.1 S2C646: ANTICIPATOR FUNCTION

This parameter specifies anticipation output.

- 0 : Invalid
- 1 : Valid

The anticipator function is a function to quicken or slow the ON/OFF timing of four user output signals and two user output groups. Using this function, signal output can be carried out before or after the step is reached. As a result, timing deviation due to delayed motion of peripheral devices and robot motion can be adjusted.

Setting the time to a negative value (-) advances the signal output.

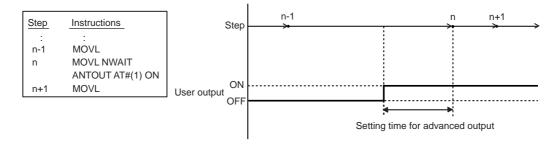

This setting is effective when adjusting timing deviation due to delayed motion of peripheral devices.

Setting the time to a positive value (+) delays the signal output.

This setting is effective when adjusting timing deviation due to delayed robot motion.

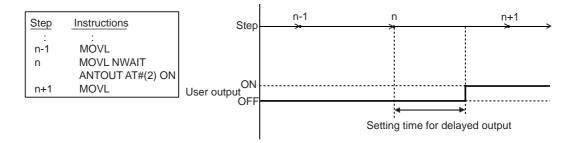

<Advanced Signal Output>

Signal output is carried out before the step is reached.

## <Delayed Signal Output>

Signal output is carried out after the step is reached.

<sup>163543-1CD</sup> Spot and Arc Welding Using Motor Gun	<ul><li>8 Parameter</li><li>8.8 Hardware Control Parameters</li></ul>
8.8.0.2 S4C327 to S4C39	0: SETTING OF OPERATING RELAY NO.
	Up to 64 output signals can be turned ON/OFF with the programming pendant. The object relay No. is set in these parameters. Although it is possible to set optional values for output No. 1 to 1024 in the parameters, the following must be taken into consideration.
	<ul> <li>Avoid setting duplicate numbers.</li> </ul>
	<ul> <li>The signal turned ON or OFF with the programming pendant is operated again or remains unchanged until the instruction is executed.</li> </ul>

## 8.8.0.3 S4C391 to S4C454: OPERATING METHOD OF RELAYS

These parameters specify the operating method of output signals by the programming pendant. The operating method can be specified for each output signal.

Parameter Setting Value	Operation of Output Signal
0	<sup>+</sup> ONO_O_ ON <sup>-</sup> OFFO_O_ OFF
1	+ON       ON/OFF with the key         ON while the key       is pressed         is pressed      OON         OFF if the key is      OOFF         not pressed      OFF

## 8.8.0.4 S2C786 to S2C788: COOLING FAN ALARM DETECTION

This parameter specifies a detection for cooling fan 1 to 3 with alarm sensor, connected to power ON unit.

- 0 : No detection
- 1 : Detected with message display
- 2 : Detected with message and alarm display

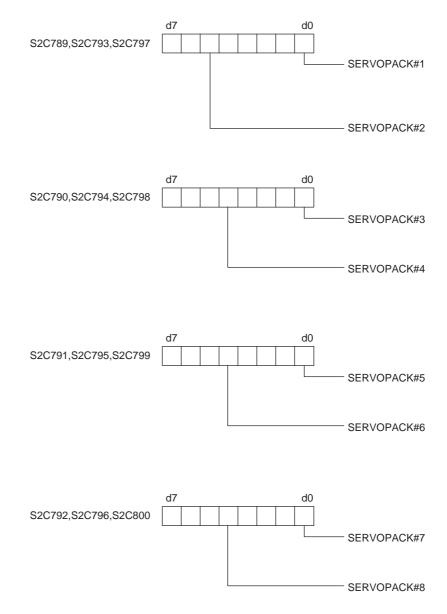

- 8 Parameter
- 8.8 Hardware Control Parameters

8.8.0.5 S2C789 to S2C792: COOLING FAN ALARM 1 OPERATION

- 8.8.0.6 S2C793 to S2C796: COOLING FAN ALARM 2 OPERATION
- 8.8.0.7 S2C797 to S2C800: COOLING FAN ALARM 3 OPERATION

These parameters specify the operation of cooling fan 1 to 3 with alarm sensor, connected to power ON unit.

Each bit specifies the power ON unit to which the detecting sensor is connected.

## 8.8.0.8 S2C801 to S2C804: FAN ALARM 1 POWER SOURCE STATUS

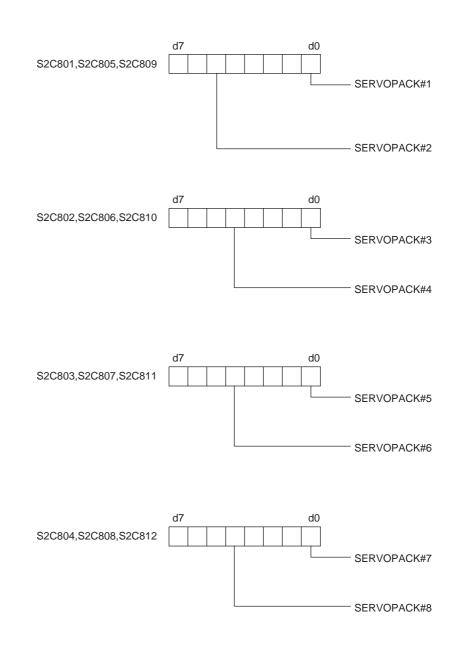

8.8.0.9 S2C805 to S2C808: FAN ALARM 2 POWER SOURCE STATUS

Spot and Arc Welding	8	Paramet

8 Parameter8.8 Hardware Control Parameters

8.8.0.10 S2C809 to S2C812: FAN ALARM 3 POWER SOURCE STATUS

- 8 Parameter
- 8.9 TRANSMISSION PARAMETERS

## 8.9 TRANSMISSION PARAMETERS

These parameters are used when the optional FC1, FC2, or data transmission function is used.

For details, refer to the optional manual "DX100 DATA TRANSMISSION FUNCTION".

## 8.10 Application Parameters

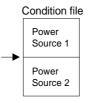

### 8.10.1 Arc Welding

8.10.1.1 AxP000: APPLICATION

This parameter specifies the application. Set "0" for arc welding.

#### 8.10.1.2 AxP003: WELDING ASSIGNMENT OF WELDING START CONDITION FILE

This parameter specifies the beginning condition number in the welding start condition file to be assigned to Power Source 2. Condition files of a lower number are automatically assigned to Power Source 1. For a system with one Power Source, set "49" (maximum value).

## 8.10.1.3 AxP004: WELDING ASSIGNMENT OF WELDING END CONDITION FILES

This parameter specifies the beginning condition number in the welding END condition file to be assigned to Power Source 2. Condition files of a lower number are automatically assigned to Power Source 1. For a system with one Power Source, set "13" (maximum value).

#### 8.10.1.4 AxP005: WELDING SPEED PRIORITY

This parameter specifies whether the welding speed is specified by the "ARCON" instruction, by the welding start condition file, or by the additional times of the "MOV" instruction.

#### 8.10.1.5 AxP009: WORK CONTINUING

This parameter specifies whether to output an "ARCON" instruction to restart after the manipulator stopped while the "ARCON" instruction is being output.

163543-1CD			
Spot and Arc Welding Using Motor Gun	8 Parameter 8.10 Application Parameters		
8.10.1.6 AxP010: WEL			
	This parameter specifies the beginning number (0 to 12) of the analog output channel to the Power Source. "0" indicates that no Power Source exists.		
8.10.1.7 AxP011, AxP	012: MANUAL WIRE OPERATION SPEED		
	These parameters specify the manual wire operation speed as a percentage of the maximum instruction value. Instruction polarity is determined by the current instruction in the Power Source characteristic file. The setting range is from 0 to 100.		
8.10.1.8 AxP013, AxP	014: WELDING CONTROL TIME		
	These parameters specify the welding control time in units of minutes. The setting range is from 0 to 999.		
8.10.1.9 AxP015 to Ax	P017: NUMBER OF WELDING CONTROL		
	These parameters specify the number of welding controls. The setting range is from 0 to 99.		
8.10.1.10 AxP026 to A	xP029: TOOL ON/OFF USER OUTPUT NO. (Jigless system)		
	These parameters specify the user output number for the tool open/close operation by specific keys.		
8.1	0.2 Handling Application		
8.10.2.1 AxP002, AxP	004: f1 KEY FUNCTION		
	These parameters set the output signal to assign for f1 key.		
	0: Not specified		
	1 to 4: Specific outputs for HAND-1 to HAND4-1		
	5: User output (No. is specified by AxP004).		
8.10.2.2 AxP003, AxP	005: f2 KEY FUNCTION		
	These parameters set the output signal to assign for f2 key.		
	0: Not specified		
	1 to 4: Specific outputs for HAND-2 to HAND4-2		
	5: User output (No. is specified by AxP005)		
8.1	0.3 Spot Welding		
8.10.3.1 AxP003: MA>	(IMUM NUMBER OF CONNECTED POWER SOURCES		
	This parameter specify the maximum number of power sources which are to be used. The value is automatically set at start-up. No modification is		

needed.

Spot and Arc Welding Using Motor Gun

- 8 Parameter
- 8.10 Application Parameters

### 8.10.3.2 AxP004: GUN FULL OPEN STROKE ON/OFF SIGNAL

This parameter specifies which stroke switching signal is output ON or OFF to make the gun fully-opened for each gun.

Bit specification (1 for 01) for 8 guns. The initial setting is "0".

0 0 0 0 0 0 0 0 0 | | | | | | | | 8 7 6 5 4 3 2 1 Gun number

#### 8.10.3.3 AxP005: STROKE CHANGE ANSWER TIME LIMIT

When using the X2 gear mechanical stopper gun and switching gun stroke, this parameter sets the time from the stroke-switching-sequence start until the pressure instruction end.

The initial setting is "0", with which the switching signal is output for the "stopper-type stroke switching time" set in the file, and then the gun pressure instruction is turned OFF.

#### 8.10.3.4 AxP006: PARITY SPECIFICATION FOR WELDING CONDITIONS

When adding the parity signal to the welding condition signal with the Power Source connected to each welding gun, this parameter specifies odd or even parity.

Bit specification for 4 Power Sources. (0 : odd number, 1 : even number) The initial setting is "0".

0 0 0 0 0 0 0 0

4 3 2 1 Power Source number

#### 8.10.3.5 AxP007: ANTICIPATE TIME

When executing the GUNCL or SPOT instruction with NWAIT specified in the previous move instruction but the time is not specified by ATT in the GUNCL or SPOT instruction, this parameter specifies the anticipate condition (time). The initial setting is "0", with which the each instruction is executed as soon as the taught position of the previous move instruction is reached, as normal operation.

#### 8.10.3.6 AxP015: WELDING ERROR RESET OUTPUT TIME

This parameter sets the output time of the welding error reset signal to the Power Source when the alarm reset signal is input.

If the setting is "0", the welding error reset signal is not output to the Power Source even if the alarm reset signal is input.

#### 8.10.3.7 AxP016, AxP017: ELECTRODE WEAR AMOUNT ALARM VALUE

These parameters set the electrode wear amount alarm values (AxP016: movable side, AxP017: fixed side) at the wear detection.

163543-1CD	
Spot and Arc Welding	8 Parameter
Using Motor Gun	8.10 Application Parameters

## 8.10.4 General-purpose Application

8.10.4.1 AxP009: WORK CONTINUE PROHIBIT

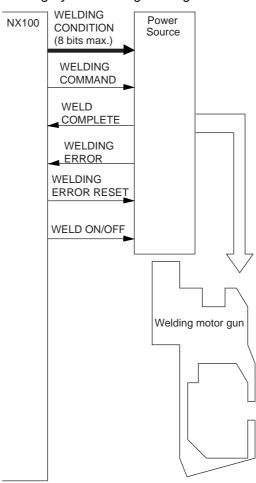

This parameter specifies whether to output TOOLON instruction or not at restarting when the work is stopped for some reasons during the output of TOOLON instruction.

- 9 Spot Welding Application Using a Motor Gun
- 9.1 System Overview

## 9 Spot Welding Application Using a Motor Gun

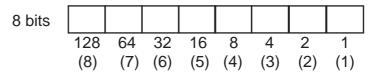

## 9.1 System Overview

An I/O signal diagram of a typical system is shown below.

- Welding conditions (level signals)
  - Sets the welding conditions for the Power Source.
  - The output format can be set as binary or discrete.
  - Can handle up to 255 conditions in binary.

The numbers in parentheses are for discrete.

• WELDING COMMAND (level/pulse)

Outputs the start instruction to the Power Source.

WELDING ERROR RESET (level)

Spot and Arc Welding Using Motor Gun

9 Spot Welding Application Using a Motor Gun

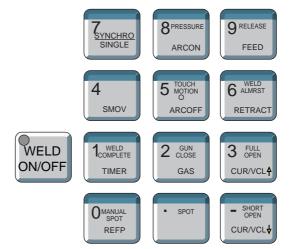

9.2 Function Keys

Resets the welding alarm status of the Power Source.

For details on signal contents, refer to Section 9.9.2 on page 9-99.

## 9.2 Function Keys

Each function used for spot welding is allocated on the Numeric keys of the programming pendant.

	Displays the MANUAL SPOT window.
Omanual Spot REFP	
	[INTERLOCK] + [WELD COMPLETE]
1 <sub>COMPLETE</sub> TIMER	Forcibly release WAIT instruction. (only when specifying of force release for WAIT instruction is valid (S2C317 d1 bit =1))
• SPOT	Displays the SVSPOT instruction in the input buffer line in order to register spot welding operation. [INTERLOCK] + [SPOT] With the MANUAL SPOT window, press these keys to execute manual spot welding.
2 CLOSE GAS	Displays the SVGUNCL instruction in the input buffer line in order to register dry spot welding operation. [INTERLOCK] + [GUN CLOSE] With the MANUAL SPOT window, press these keys to execute manual dry spot welding.

## Spot and Arc Welding Using Motor Gun

# 9 Spot Welding Application Using a Motor Gun9.2 Function Keys

	[INTERLOCK] + [WELD ON/OFF]
WELD ON/OFF	Turns the welding ON/OFF signal ON or OFF.
- SHORT OPEN CUR/VCL	The SHORT OPEN POSITION SETTING window appears the first time this key is pressed. The selection No. for the short open position is replaced by pressing this key while the SHORT OPEN POSITION SETTING window is appeared.
	[INTERLOCK] + [SHORT OPEN] The movable side electrode moves to the selected short open position.
3 FULL OPEN CUR/VCL	The FULL OPEN POSITION SETTING window appears the first time the key is pressed. The selection No. for the full open position is replaced by pressing this key while the FULL OPEN POSITION SETTING window is appeared.
	[INTERLOCK] + [FULL OPEN] The movable side electrode moves to the selected full open position.
4 smov	Selects either a coordinated or an individual interpolation when teaching a coordinated job. Each time this key is pressed, the operation type changes.
	Coordinated: All the move instructions that are registered in this mode become coordinated instructions. Individual: The master-slave relationship is cancelled. Each manipulator and station moves independently.
6 ALMRST RETRACT	[INTERLOCK] + [WELD ALM RESET] A Power Source alarm reset signal is output to the Power Source while these keys are held down.
Z <u>YNCHRO</u> SINGLE	Changes the type of movement for the manipulator when teaching a coordinated job. Each time this key is pressed, the movement type changes.
	SYNCRO: The mark for "synchronized" appears in the status display area. When the master side is moved, the slave side will follow the movement of the master. SINGLE: Only the selected group axis moves.
8 <sup>pressure</sup> Arcon	[INTERLOCK] +[PRESSURE] With the MANUAL SPOT window or the JOB window, press these keys to execute pressurizing.
9 RELEASE FEED	[INTERLOCK] +[RELEASE] Releases the electrode.

## 9.3 Before Teaching

Before using the motor gun, execute the following operation instructions.

## 9.3.1 Manual Welding

For manual welding, perform the following operations.

1. Press [0/MANUAL SPOT] of the Numeric keys.

	١
0 MANUAL SPOT	
REFP	
	,

2. Press [INTERLOCK] + [./SPOT].

INTER LOCK	<ul> <li>SPOT</li> </ul>

Manual welding is executed while these keys are held down when the MANUAL SPOT window is displayed.

Manual welding uses the conditions that are set in the MANUAL SPOT window.

SUPPLE-MENT

Refer to Section 9.4.1 "Setting of MANUAL SPOT Window" on page 9-12 for the condition settings.

- 9 Spot Welding Application Using a Motor Gun
- 9.3 Before Teaching

## 9.3.2 Manual Dry Spotting

For manual dry spotting, perform the following operations.

1. Press [0/MANUAL SPOT] of the Numeric keys.

2. Press [INTERLOCK] + [2/GUN CLOSE].

Manual dry spotting is executed when pressing the above mentioned keys while the MANUAL SPOT window is displayed.

The conditions that are set in the MANUAL SPOT window are applied to Manual dry spotting.

Refer to Section 9.4.1 "Setting of MANUAL SPOT Window" on page 9-12 for the condition settings.

## 9.3.3 Open/Close of a Motor Gun

Open and close the motor gun in the following operations.

1. Press [EX. AXIS].

- The LED on [EX. AXIS] is lit.
- 2. Choose the control group of the gun-axis
  - Each time [EX.AXIS] is pressed, the objective external axis alternates.
- 3. Press [FAST] or [SLOW] keys to set the axis manual speed.

- Refer to Section 2.2 "General Operations" on page 2-3 for the details.
- 4. Press [S+] or [S-].

Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.3 Before Teaching

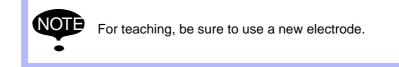

- The motor gun performs an "open motion" or a "close motion".

- NOTE
- The opening and closing direction of the motor gun differs depending on the gun type.
  - When setting the manual speed, be sure to select "slow speed" to check the opening and closing direction of the gun.

## 9.3.4 Mounting Electrodes

Mount the electrodes in a dry spotting motion.

For dry spotting, refer to Section 9.3.2 "Manual Dry Spotting" on page 9-7.

## 9.3.5 Registering the Operation Tool

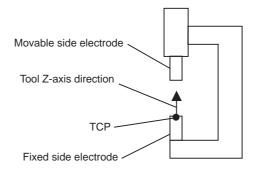

The registration method of operation tool differs depending on whether it is a single gun or a double gun.

Considering the following cases, refer to "8.3 Tool Data Setting" of "DX 100 INSTRUCTIONS" (162536-1CD) for the tool coordinate value and tool data setting.

## 9.3.5.1 When Using a Single Gun

Register the tool coordinate value of the fixed side electrode tip position as TCP.

Set the tool posture data so that the direction from the fixed side electrode to the movable side electrode is positive (+) side of Z-axis.

Be sure to set the direction of tool Z-axis facing the movable side electrode.

If the Z-axis is not set in the correct direction, wear of the electrode cannot be properly compensated for.

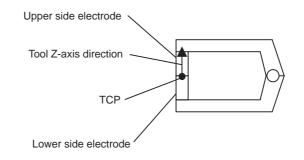

Spot and Arc Welding Using Motor Gun

9 Spot Welding Application Using a Motor Gun9.3 Before Teaching

#### 9.3.5.2 When Using a Double Gun

Register the tool coordinate value of the both fixed side and movable side electrode contact position of as TCP.

Set the tool posture data so that the direction from the lower side electrode to the upper side electrode is positive (+) side of Z-axis.

Be sure to set the tool Z-axis in the direction from the lower side electrode to the upper side electrode. If the Z-axis is not set in the correct direction, wear of the electrode cannot be properly compensated for.

#### 9.3.6 Teaching

This section explains how to prepare a job with a robot axis and a gun axis to use the motor gun.

#### 9.3.6.1 Preparing a Pressure Instruction Job

- 1. Select {JOB} from the main menu.
- 2. Select {CREATE NEW JOB}.

- 3. Enter a job name.
- 4. Set a control group.
  - Set a control group which includes a gun-axis.
  - The gun-axis is registered as a station.
  - When the gun is preparing for a robot, be sure to register "Robot + Station (gun-axis)" control group.

Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.3 Before Teaching
  - The pressure compensation function doesn't work properly when the job is for a control group of gun-axis only.

(Example Case) Robot: R1, Gun-Axis: S

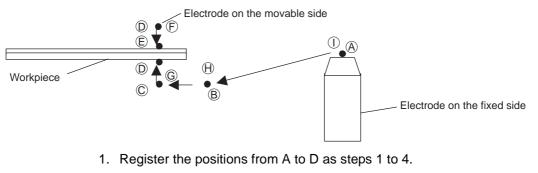

Select "R1+S1" for a control group

JOB	EDIT	DISPLAY	UTILITY	I ≤ 1 ≪ 10	3 (h
NEW JOB CRE JOB NAME COMMENT GROUP SET	Т	EST I I I I I I I I I I I I I I I I I I I			
EXECUT	E	OA)(CE	L		
Main Menu	Sho	ert Out			

- Refer to Section 9.8.8 "Gun Pressure Compensation Function" on page 9-55 for the details of gun pressure compensation.
- 5. Press [ENTER]
  - Refer to Section 3.1.3 "Registering a Job" on page 3-2 for details.

## 9.3.6.2 Registering Steps

Register the steps in the following operations

- 2. Close the gun until position E, and then register it as step 5 in the job.
- 3. Open the gun until position F, and then register it as step 6 in the job.
- 4. Register the positions from G to I as steps 7 to 9.
  - Position E should not touch the workpiece. Keep 5 to 10 millimeters between the workpiece and the electrode.

- By registering a SVSPOT (Spot Welding Execution) instruction after step 5, the tool end touches the workpiece in the touch motion.
- For double-gun control, teach positions D and E in the same step, and also positions F and G in the same step.

Spot and Arc Welding Using Motor Gun

9 Spot Welding Application Using a Motor Gun9.3 Before Teaching

9.3.6.3 Registering the SVSPOT Instruction

Register a SVSPOT instruction by pressing [./SPOT].

в С

D

A. Gun No.

Specifies the gun No. to be used for welding.

**B. Gun pressure file No.** 

А

Specifies the file No. to which the pressure is set.

C. Welding condition No.

Specifies the welding condition No. set for the Power Source.

#### D. Power Source start signal output timing

Specifies the timing to start the Power Source.

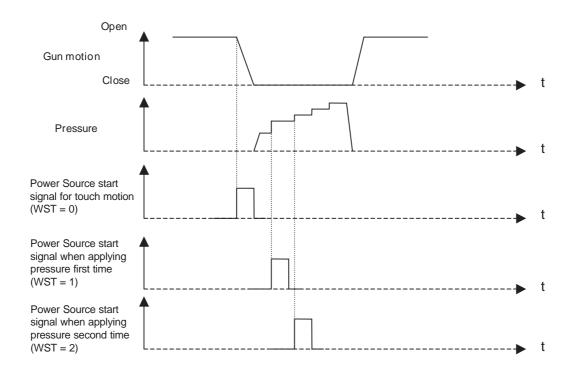

Choose from the following three settings.

• WST=0 : The Power Source starts at the same time as the SVSPOT instruction.

As the Power Source starts before pressure is applied, a squeeze time for the Power Source is required.

- WST=1 : The Power Source starts at the same time as pressure is applied for the first time.
- WST=2 : The Power Source starts at the same time as pressure is applied for the second time.

## Power Source Start Signal Output Timing

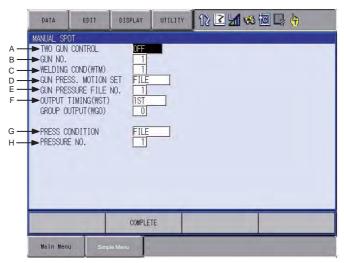

# Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.4 Setting Welding Conditions

## 9.4 Setting Welding Conditions

- 9.4.1 Setting of MANUAL SPOT Window
  - Manual Setting window

## A. TWO GUN CONTROL

For two gun control, selects "ON" or "OFF" of synchronous control.

## B. GUN NO.

Set the gun No. for pressurizing.

- C. WELDING COND (WTM)
- Set the welding condition No. which applies to the welding.
- D. GUN PRESS. MOTION SET
  - Select "FILE" to specify settings.
- E. GUN PRESSURE FILE NO.
- Set the gun pressure file No. used for the welding.

## F. OUTPUT TIMING (WST)

Shows the timing to start the Power Source. It can be selected from the following three.

- TOUCH: Starts the Power Source at the same time as the SVSPOT instruction is carried out. Since the Power Source starts operation before pressure is applied, a squeeze time for the Power Source is required.
- 1ST PRESS: Starts the Power Source at the same time as pressure is applied for the first time.
- 2ND PRESS: Starts the Power Source at the same time as pressure is applied for the second time.

## **G. PRESS CONDITION**

Shows the pressurizing method in a dry spotting. It can be selected from the following two methods.

- FILE: The pressure is applied according to the settings in the dry spotting pressure file.
- FIXED: Dry spotting is done with the pressure specified in "CONST PRESSURE".

## H. PRESSURE NO. or CONST PRESSURE

PRESSURE NO.: Set the dry spotting pressure file No. for pressurizing CONST PRESSURE: Shows the pressure for the dry spotting.

## Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.4 Setting Welding Conditions

#### Operation

1. Press [0/MANUAL SPOT] of the Numeric keys.

- Manual spot window appears.

- 2. Select the item to be set.
- 3. Enter a numerical value and press [ENTER].
  - When selecting "OUTPUT TIMING (WST)", "TOUCH", "1ST PRESS" or "2ND PRESS" appear alternately after pressing "SELECT".
  - When selecting "PRESS CONDITION", "FILE" or "CST PRESS" appear alternately after pressing "SELECT".

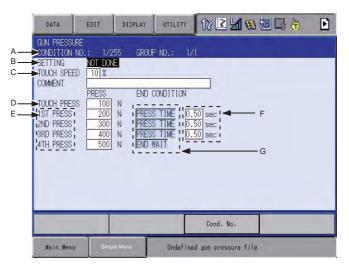

# Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.4 Setting Welding Conditions

## 9.4.2 Pressure Setting

The pressure used for welding is specified by the gun pressure file selected for the SVSPOT.

## Gun Pressure Display

## A. CONDITION NO.

Expresses the No. of the gun pressure file.

Select the file No. by pressing the page key  $\fbox$  .

## **B. SETTING**

Shows whether the values are entered in the gun pressure file or not. For a file where the values are not entered, "NOT DONE" appears and " DONE" appears for the files with the values are entered.

## C. TOUCH SPEED

Shows the electrode speed when the gun closes.

It is shown as a ratio (%) to the gun motor rated speed.

## **D. TOUCH PRESS**

Shows the pressure when electrode touches a workpiece. When the pressure reaches the touch pressure value after the electrode touches the workpiece, the first pressure that is set in E is applied.

## E. 1ST to 4TH PRESS

Shows the pressure at each speed.

## F. 1ST to 4TH END CONDITION

Shows the condition needed to end application for each pressure. "PRS TIME (pressure time)" or "END WAIT (welding end wait)" can be chosen.

- PRS TIME: The gun applies a pressure for the time specified in the next item G.
- END WAIT: The gun's application of pressure ends when a welding end signal comes from the Power Source.

When "END WAIT" is selected for 1ST to 3ED PRESS, the conditions required by the gun to apply pressure for the further steps are not displayed.

## G. 1ST to 4TH PRS TIME

Shows the pressure time of each pressure. When "END WAIT" is selected as the END CONDITION, the pressure time is not displayed.

## Spot and Arc Welding Using Motor Gun

# Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.4 Setting Welding Conditions

For C : Yaskawa recommends the setting to 5%.

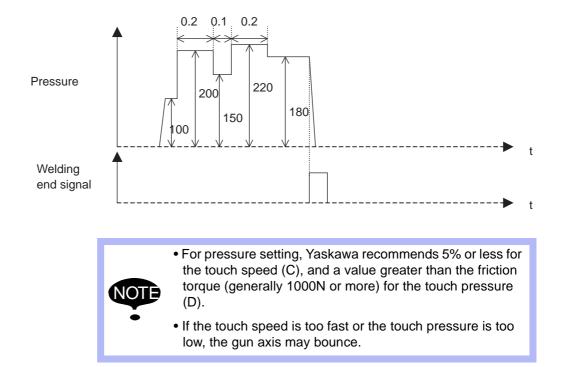

For D and E : Request settings so that the touch pressure is less than or equal to the 1st pressure.

The actual pressure relative to the specified pressure may not be ensured if the above conditions are not satisfied.

#### Table 9-1: <Example>

	Pressure (N)	End Condition	
TOUCH PRESS	1000		
1ST PRESS	200.0	PRS TIME	0.20 s
2ND PRESS	150.0	PRS TIME	0.10 s
3RD PRESS	220.0	PRS TIME	0.20 s
4TH PRESS	180.0	END WAIT	

## 9.4.3 Welding Current and Welding Time Settings

The welding current and the welding time are set according to the Power Source.

Refer to the Operator's manual of the Power Source.

The welding condition No. set to the Power Source should be the same as the welding condition No. specified in the SVSPOT instruction.

- 9 Spot Welding Application Using a Motor Gun
- 9.5 Playback (Motor Gun)

## 9.5 Playback (Motor Gun)

This section explains the check run and the actual welding.

### 9.5.1 Check Run

Confirm the taught path in a check run. The check run is a dry run, so welding instructions such as SVSPOT are not carried out.

- 1. Set the mode switch to "PLAY" on the programming pendant.
- 2. Select {UTILITY} under the menu.
- 3. Select {SETUP SPECIAL RUN}.
- 4. Select "CHECK-RUN" to set to "VALID".

## 9.5.2 Actual Welding

After having confirmed the taught path, start welding.

To start the SVSPOT instruction, select "CHECK-RUN" on the SPECIAL PLAY window to set to "INVALID".

## 9.6 Dry Spotting (Motor Gun)

For dressing a tip and mounting an electrode, a gun motion to apply pressure without welding (dry spotting) is required.

Dry spotting can be also registered in a job to be executed.

## 9.6.1 SVGUNCL (Dry Spotting Motion) Instruction

Register the SVGUNCL instruction by pressing [2/GUN CLOSE].

SVGUNCL GUN#(1) PRESSCL#(1)

А

В

## A. Gun No.

Specifies the gun No. to start dry spotting.

It is used with the SVSPOT instruction in the same manner.

### B. Pressure file No.

Specifies the file No. where the pressure for dry spotting is set.

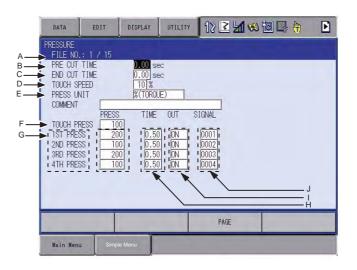

## 9.6.2 Dry Spotting Pressure Setting

The pressure for dry spotting is specified by the pressure file selected for the SVGUNCL instruction

# Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.6 Dry Spotting (Motor Gun)

## PRESSURE window

## A. FILE NO.

Shows the dry spotting pressure file No.

Select a number by pressing the page key

## **B. PRE CUT TIME**

Shows the time from when the tip dresser rotating signal is output to the moment the gun starts applying pressure.

## C. END CUT TIME

Shows the time from when the application of pressure stops to the moment the output signal to the tip dresser is turned OFF.

## D. TOUCH SPEED

Shows the electrode speed when the gun closes. It is shown as a ratio (%) to the gun motor rated speed.

## E. PRESS UNIT

Shows the units for dry spotting pressure. Select "N" or "% (TORQUE)".

## F. TOUCH PRESS

Shows the pressure when electrode touches a workpiece. When the pressure reaches the touch pressure value after the electrode touched the workpiece, the first pressure that is set in G is applied.

## G. 1ST to 4TH PRESS

Shows the dry spotting pressure at each step.

## H.1ST to 4TH PRESS TIME

Shows the pressure time of each dry spotting pressure.

I. 1ST to 4TH PRESS OUT (ON/OFF status of 1st to 4th pressure synchronizing output signal)

Shows the ON/OFF status of the user output signal which is output in synchronization with each dry spotting pressure.

When a synchronizing signal is output to a tip dresser, etc., select "ON".

## J. 1ST to 4TH PRESS SIGNAL (1st to 4th pressure synchronizing output signal)

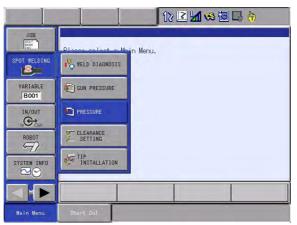

Shows the No. of the user output signal which is output in synchronization with each dry spotting pressure.

## Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.6 Dry Spotting (Motor Gun)

### Operation

- 1. Select {SPOT WELDING} from the main menu.
- 2. Select {PRESSURE}.

- Gun pressure display appears.

## 9.7 Electrode Wear Detection and Wear Compensation

#### 9.7.1 Wear Detection and Wear Compensation Operation Flow Chart

# Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.7 Electrode Wear Detection and Wear Compensation

### 9.7.2 Wear Detection

This section explains the method to detect the amount of the electrode wear by dry spotting touch motion and sensor detection.

## 9.7.2.1 Dry Spotting Touch Motion

Read the position where the movable side (upper) electrode touches the fixed side (lower) electrode, and then calculate the total amount of electrode wear on both sides.

Touching during dry spotting is done by carrying out a SVGUNCL (dry spotting) instruction.

#### <Example>

## SVGUNCL GUN#(1) PRESSCL#(1) TWC-A

A B C

## A. Gun No.

- B. Dry spotting pressure file No.
- C. Dry spotting touch motion designation

#### 9.7.2.2 Sensor Detection

Move the movable side (upper) electrode to the sensor detectable position, and read the position to calculate the amount of electrode wear on the movable side.

Detect the electrode position using a sensor by carrying out a SVGUNCL (dry spotting) instruction.

## <Example>

SVGUNCL GUN#(1) PRESSCL#(1) TWC-B

В

С

- A. Gun No.
- **B.** Dry spotting pressure file No.

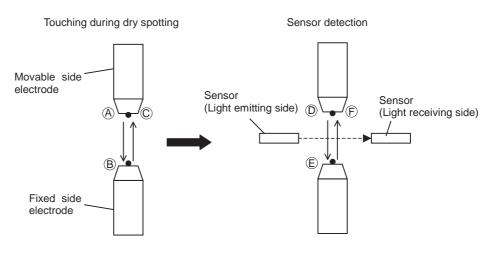

А

C. Sensor detection designation

# Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.7 Electrode Wear Detection and Wear Compensation

#### 9.7.2.3 Example of Wear Detection

<Job Example>

- A. MOVJ
- B. SVGUNCL GUN#(1) PRESSCL#(1) TWC-A (Dry spotting touch motion)
- C. MOVJ
- D. MOVJ
- E. SVGUNCL GUN#(1) PRESSCL#(1) TWC-B (Sensor detection)
- F. MOVJ

For double-gun control, teach a job so that the upper side electrode passes the sensor detecting zone while using the sensor detection.

Also, set the polarity of the signal that is output from the sensor, by the setting item "WEAR DETECT SENSOR POLARITY" in the GUN CONDITION window. (Refer to Section 9.10.1 "Gun Condition File" on page 9-100.)

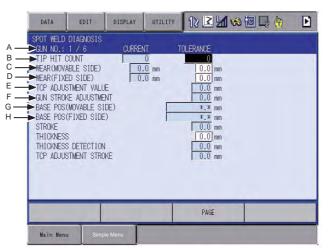

#### 9.7.3 SPOT WELD DIAGNOSIS

The amount of electrode wear is displayed. The allowable wear amount can also be set.

# Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.7 Electrode Wear Detection and Wear Compensation

## Welding Diagnosis Window

## A. GUN NO.

Shows the gun No. Select a number by pressing the page key

## **B. TIP HIT COUNT (CURRENT, TOLERANCE)**

"CURRENT" shows the number of times the SVSPOT instruction was carried out. When the current value exceeds the allowable value (TOLERANCE,) a signal to request tip replacement is output.

- **C. WEAR (MOVABLE SIDE) (CURRENT, TOLERANCE)** "CURRENT" shows the current amount of electrode wear on the movable side. When the current value exceeds the allowable value (TOLERANCE,) a signal to request tip replacement is output.
- D. WEAR (FIXED SIDE) (CURRENT, TOLERANCE)

"CURRENT" shows the current amount of electrode wear on the fixed side. When the current value exceeds the allowable value (TOLERANCE,) a signal to request tip replacement is output.

E. TCP ADJUSTMENT VALUE

Shows the amount of shift from the TCP.

F. GUN STROKE ADJUSTMENT

Shows the adjusted amount of gun stroke.

## G. BASE POS (MOVABLE SIDE)

Registers the first detected position (position where the signal from the sensor is input) after the reference data is cleared. For the second detection or later, calculates the difference from the reference position as the wear amount.

## H. BASE POS (FIXED SIDE)

Registers the first detected position (position at dry spotting) after the reference data is cleared.

For the second detection or later, calculates the difference from the reference position as the wear amount.

## Spot and Arc Welding Using Motor Gun

# Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.7 Electrode Wear Detection and Wear Compensation

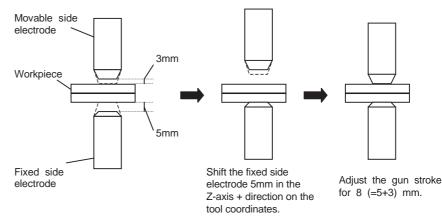

## 9.7.4 Wear Compensation

The manipulator motion and the gun stroke are adjusted according to the amount of electrode wear.

The step registered immediately before the SVSPOT instruction compensates for the amount of wear.

<Example of Wear Compensation>

For a single gun, the amount of wear on the movable side = 3mm; the amount of wear on the fixed side = 5mm.

### <Job Example>

MOVJ

 $MOVJ \leftarrow In$  this position, wear compensation is done.

SVSPOT GUN#(1) PRESS#(1) WTM=1 WST=1

MOVJ

MOVJ

The fixed side electrode is always shifted in the Z-axis + direction on the tool coordinates. Therefore, be sure to register the tool position and direction correctly. (Refer to *Section 9.3.5 "Registering the Operation Tool" on page 9-8.*)

## Spot and Arc Welding Using Motor Gun

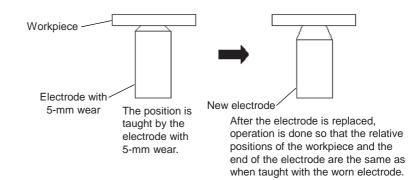

9 Spot Welding Application Using a Motor Gun

9.7 Electrode Wear Detection and Wear Compensation

### 9.7.5 Teaching Positions with a Worn Electrode

When teaching positions with a worn electrode, the position is registered according to the electrode wear amount.

### 9.7.5.1 Teaching Example

This effect occurs only with the move instruction immediately before the SVSPOT instruction. The wear amount is ignored when registering positions with other move instructions.

### 9.7.5.2 Parameters

AxP010: Teaching with compensation enabled value for wear (units: µm)

Sets the reference value of the wear amount where compensation becomes enabled. Compensation is carried out when the wear amount exceeds the reference value.

<Example>

In the case of AxP010 = 1000:

Wear amount  $\geq$  1mm : The taught position is registered according to the wear amount.

Wear amount < 1mm : The taught position is registered disregarding the wear amount.

AxP014: Selection of compensation execution and display

0: A message "Compensated position". appears when the position is registered.

1: The dialog box appears before the position is registered with a message "Compensate? YES/NO".

# Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.7 Electrode Wear Detection and Wear Compensation

## 9.7.6 Wear Amount Loading

Detected wear amount can be loaded in a job.

The wear amount is stored in the system D variable (\$D). Use the GETS instruction and load the wear amount.

## <Example>

## GETS D000 \$D030

The wear amount of Gun 1 (movable side) is stored in D000.

	(Unit: μm)
\$D30	Gun 1 movable side (upper) wear amount
\$D31	Gun 1 fixed side (lower) wear amount
\$D32	Gun 2 movable side (upper) wear amount
\$D33	Gun 2 fixed side (lower) wear amount
\$D34	Gun 3 movable side (upper) wear amount
\$D35	Gun 3 fixed side (lower) wear amount
\$D36	Gun 4 movable side (upper) wear amount
\$D37	Gun 4 fixed side (lower) wear amount
\$D38	Gun 5 movable side (upper) wear amount
\$D39	Gun 5 fixed side (lower) wear amount
\$D40	Gun 6 movable side (upper) wear amount
\$D41	Gun 6 fixed side (lower) wear amount
\$D42	Gun 7 movable side (upper) wear amount
\$D43	Gun 7 fixed side (lower) wear amount
\$D44	Gun 8 movable side (upper) wear amount
\$D45	Gun 8 fixed side (lower) wear amount
\$D46	Gun 9 movable side (upper) wear amount
\$D47	Gun 9 fixed side (lower) wear amount
\$D48	Gun 10 movable side (upper) wear amount
\$D49	Gun 10 fixed side (lower) wear amount
\$D50	Gun 11 movable side (upper) wear amount
\$D51	Gun 11 fixed side (lower) wear amount
\$D52	Gun 12 movable side (upper) wear amount
\$D53	Gun 12 fixed side (lower) wear amount

## 9.8.2 Gun Change

This section explains the gun change function.

9.8.2.1 Gun Change Instruction

Remove or mount a gun with the GUNCHG (gun change) instruction.

<Example>

GUNCHG GUN#(1) PICK

A B

# A. Gun No.

## B. Designation of mounting or removing a gun

When "PICK (gun mounted)" is selected, the power supply of the gun motor is turned ON.

When "PLACE (gun removed)" is selected, the power supply of the gun motor is turned OFF.

- 9 Spot Welding Application Using a Motor Gun
- 9.8 Other Functions Using a Motor Gun

## 9.8.2.2 Signal Status to Execute a GUNCHG Instruction

The signals must be in the status shown in the following table when executing a GUNCHG instruction.

Signal Name	Input/ Output	Explanation	Signal Status
Gun Identification Signal	Input (3 bits)	A binary signal to identify the gun number.	Agree with Gun No. <sup>1)</sup>
Gun Connection (PICK) Confirmation Signal	Input	The signal to confirm that the gun is connected. Normally, a chucking confirmation signal of ATC is allocated.	ON
Gun Disconnection (PLACE) Confirmation Signal	Input	The signal to confirm that the gun is disconnected. Normally, an unchucking confirmation signal of ATC is allocated.	OFF
Gun Connection (PICK) Signal	Output	The signal to connect the gun. Normally, a chucking signal of ATC is allocated. (CHUCK = OFF, UNCHUCK = ON)	OFF

1 The signal must agree with the gun number as shown in the following example.

<When the gun identification signal (Start) is IN10, and the gun identification signal (End) is IN12:>

Gun No.	IN10	IN11	IN12	
GUN# (1)	ON	OFF	OFF	
GUN# (2)	OFF	ON	OFF	
GUN# (3)	ON	ON	OFF	
GUN# (4)	OFF	OFF	ON	
GUN# (5)	ON	OFF	ON	
GUN# (6)	OFF	ON	ON	

The signals listed in the table above are confirmed when the DX100 control power supply is turned ON.

If the gun is connected, the servo power supply for the gun motor turns ON when the servo is turned ON.

If the gun is not connected, the servo power supply for the robot motor turns ON when the servo is turned ON, but the servo power supply for the gun motor does not turn ON.

3. Select a signal number to be set.

When the signal number "0" is selected, the forced gunpressurizing function for dry spotting is disabled.

- 9 Spot Welding Application Using a Motor Gun
- 9.8 Other Functions Using a Motor Gun

# DRY SPOT(FILE)

- After the signal is input, pressurizing is started.
- Pressure is applied according to the settings in the dry spotting pressure file specified by "Forced Pressure File No".
- The gun stops applying pressure after a specified time period.

## DRY SPOT(CONTINUE)

- The signal input and pressurizing is started as well as the above, but pressurizing is continued during the signal input.
- When the signal is turned OFF, the gun stops applying pressure.

# 9.8.5 Electrode Wear Compensation for Fixed Gun

The electrode wear for the fixed gun (the gun that is not mounted on the manipulator) can be detected and compensated in the following manner.

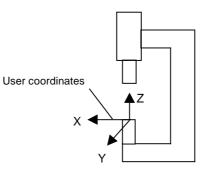

The wear amount of electrode for the fixed gun cannot be detected by the fixed sensor.

Build a system so that the sensor can move into the fixed gun's motion range to detect the electrode wear.

## 9.8.5.1 Setting the User Coordinates

Set the user coordinate system with its zero-point located on the fixed electrode end.

The + direction of the Z-axis must be towards the movable electrode.

The DX100 has the External Reference Point Control Function (the function to execute teaching or playback operation with the manipulator TCP set to a point in space).

If the direction of coordinates used for such External Reference Point Control Function is the same as that of the above coordinates, resetting the user coordinates is not required. (The coordinates set for the External Reference Point Control Function can be used.)

## 9.8.6 Clearance Teaching Function

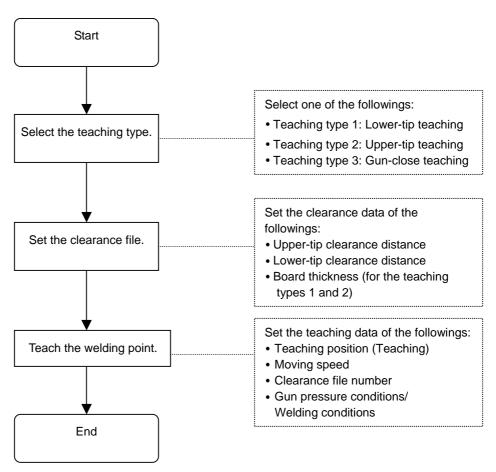

# 9.8.6.1 Operation Flow Chart

With the clearance teaching function, by specifying the clearance for the upper tip or the lower tip of the motor gun, the position taught at the welding point is automatically offset for the clearance and registered.

# Spot and Arc Welding Using Motor Gun

9 Spot Welding Application Using a Motor Gun9.8 Other Functions Using a Motor Gun

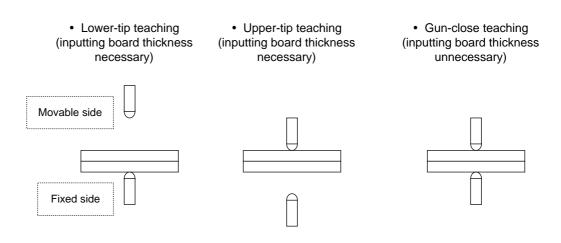

The following shows the operation flow chart for the clearance teaching.

### 9.8.6.2 Setting the Teaching Type

The following three types of settings are available; the lower-tip teaching, the upper-tip teaching, and the gun-close teaching.

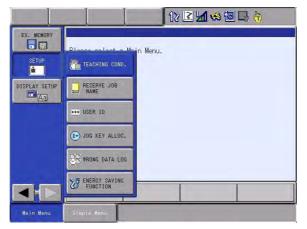

Follow the procedure to select one of the three types before teaching the welding point.

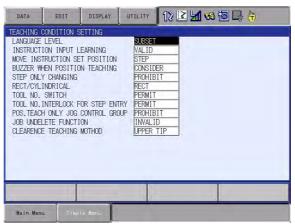

1. Select {SETUP} from the main menu.

# Spot and Arc Welding Using Motor Gun

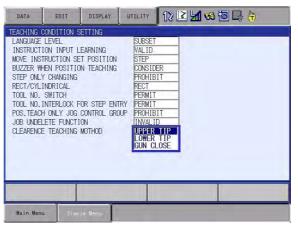

- 9 Spot Welding Application Using a Motor Gun
- 9.8 Other Functions Using a Motor Gun
- 2. Select {TEACHING COND.}.

- The TEACHING CONDITION SETTING window appears

- 3. Select {CLEARENCE TEACHING METHOD}.
  - Move the cursor to the lowest line "CLEARENCE TEACHING METHOD" and press {SELECT} to display the selection dialog box for the teaching methods to appear.

- Three teaching methods are available.
- UPPER TIP : Teaching with the upper tip contacting the workpiece
- LOWER TIP : Teaching with the lower tip contacting the workpiece
- GUN CLOSE : Teaching with both tips contacting the workpiece

## 9.8.8 Gun Pressure Compensation Function

### 9.8.8.1 Operation Flow Chart

With the gun pressure compensation function, the gun pressure can be kept stable even when the motor gun posture changes.

The following shows the operation flow chart for the gun pressure compensation.

#### 9.8.8.2 Overview

The following describes outline of the gun pressure compensation function.

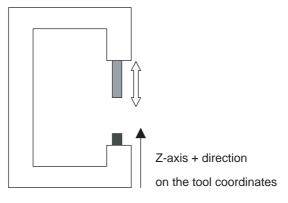

The pattern 1 is shown in the *Figure 9-2*; applying pressure downwards, and the pattern 2 is shown in the *Figure 9-3*; applying pressure upwards.

In the pattern 1, set the points (maximum twelve points) for the pressureto-torque conversion value (see *Fig. 9-5 Pressure-to-torque Conversion (For Pattern 1) on page 9-57)* of GUN CONDITION file. With this twelve points data, the specified pressure is calculated by interpolation, and the motor torque for motor gun is calculated.

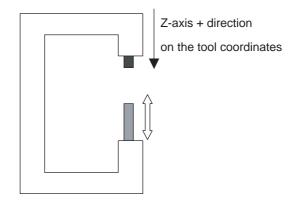

# Spot and Arc Welding Using Motor Gun

9 Spot Welding Application Using a Motor Gun9.8 Other Functions Using a Motor Gun

Fig. 9-2: Pattern 1 (Applying Pressure Downwards)

# Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.8 Other Functions Using a Motor Gun

## Fig. 9-4: GUN CONDITION File (For Pattern 1)

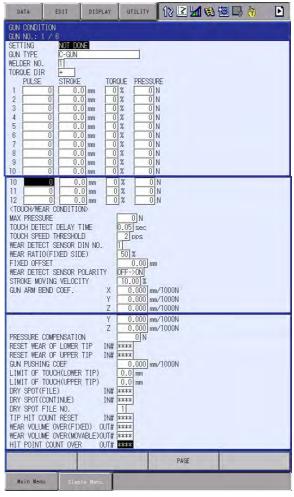

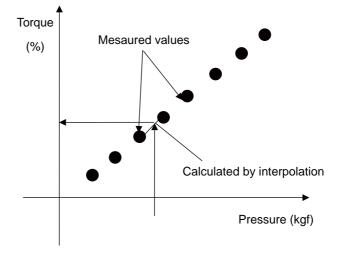

Fig. 9-5: Pressure-to-torque Conversion (For Pattern 1)

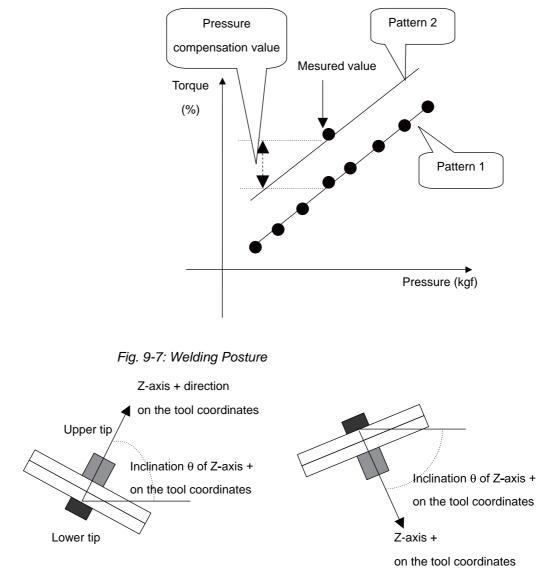

For the pattern 2 shown in *Fig. 9-3 Pattern 2 (Applying Pressure Upwards)* on page 9-56, the weight of the motor gun itself may cause deviation of pressure.

Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.8 Other Functions Using a Motor Gun

Using the gun pressure compensation function, by setting one pressure compensation value (see *Figure 9-6*), the motor torque for motor gun is calculated using the pressure-to-torque conversion value of pattern 1 and the inclination of the Z-axis + on the tool coordinates at welding so that the pressure can be kept stable even when the welding posture changes. (See *Figure 9-7*.)

## 9.8.8.3 Setting the Pressure Compensation Value

The following describes settings for pressure compensation value of pattern 2.

For details on the data registration of pattern 1; applying pressure downwards (settings for pressure-to-torque conversion value), refer to *Section 9.10 "System Setting" on page 9-100.* 

1. Select {SPOT WELDING} from the main menu.

# Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.8 Other Functions Using a Motor Gun
- 2. Select {GUN CONDITION}.

# 9.8.9 Workpiece Transfer Function Using a Motor Gun

## 9.8.9.1 Operation Flow Chart

With the workpiece transfer function, workpieces can be transferred using a motor gun.

While this function is used, the force control for grasping a workpiece and the tip wear compensation are available so that workpieces can be stably handled using a motor gun.

The following shows the operation flow chart for the workpiece transfer function.

- 9 Spot Welding Application Using a Motor Gun
- 9.8 Other Functions Using a Motor Gun

9.8.9.2 Setting the Conditions for Grasping/Releasing Workpieces

The PRESSURE file is used to set the conditions for grasping/releasing workpieces.

The following describes how to set the pressure to grasp a workpiece. Up to fifteen PRESSURE files can be used.

- 1. Select {SPOT WELDING} from the main menu.
- 2. Select {PRESSURE}.

9.8.9.4 Manual Operation for Grasping/Releasing Workpieces

This section describes how to grasp/release workpiece by manual operation on the programming pendant.

With this operation, the workpiece can be easily grasped/released when teaching the position for transferring workpieces.

This operation can be performed only in the teach mode.

- 1. Make the fixed tip contact the workpiece to let the manipulator grasp the workpiece.
  - Press [8] + [INTERLOCK] to apply pressure.
     To set the pressure conditions, use the file number specified in {PRESS NO.} in the MANUAL SPOT window.
- 2. Releasing the Workpiece
  - Press [9] + [INTERLOCK] to release the gun axis.

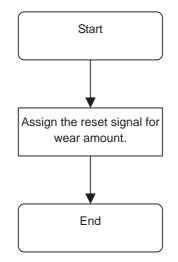

- 9 Spot Welding Application Using a Motor Gun
- 9.8 Other Functions Using a Motor Gun

# 9.8.10 Individual Reset Function for Wear Amount

9.8.10.1 Operation Flow Chart

With the individual reset function, the wear amount of the motor gun's fixed/movable tip can be reset.

The following shows the operation flow chart for the individual resetting.

#### 9.8.10.2 Procedure for Signal Assignment

The following describes the setting method of each signal so that the wear amounts on the fixed side and movable side can be reset individually.

I/O can be allocated in the GUN CONDITION window.

- 1. Select {SPOT WELDING} from the main menu.
- 2. Select {GUN CONDITION}.
  - The GUN CONDITION window appears.

### 9.8.13.3 Motion Example

The below diagram shows an example of gun stroke motion in the following conditions:

The gun stroke position when the welding start is 10.0 mm; the gun stroke motion speed is 100.0%; and the touch motion speed is 20%.

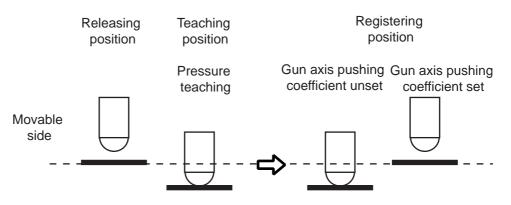

- 9 Spot Welding Application Using a Motor Gun
- 9.8 Other Functions Using a Motor Gun

#### 9.8.14 Setting the Gun Pushing Coefficient

This setting is regarded as a part of clearance teaching function and it is available only when the clearance teaching method is "GUN CLOSE".

By setting a value to the gun pushing coefficient, the position is registered after subtracting the pressure pushing value when teaching the pressure under "GUN CLOSE" setting.

By setting the gun pushing coefficient correctly, the contact point of the tip and the work can be registered as a teaching point regardless of the pressure during pressure teaching operation.

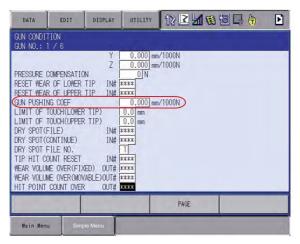

#### 9.8.14.1 Setting of gun pushing coefficient

- 1. Select [SPOT WELDING] from the main menu.
- 2. Select [GUN CONDITION].
  - The GUN CONDITION window appears.

Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.8 Other Functions Using a Motor Gun
- 3. Set the value to [GUN PUSHING COEF.]
  - Set the value (0 to 10.0 [mm/1000N]) to the gun pushing coefficient to compensate the registering position when pressure is taught.
  - Press [SELECT] to input the numerical value.

- 4. Press [ENTER].
- 9.8.14.2 Calculation of Gun Pushing Coefficient

Set a pressure per 1000N [mm] to GUN PUSHING COEFFICIENT. Fig. 9-8: Relation Between Pressure and Gun Axis Position [mm]

Following the relation mentioned above, calculate the change of gun axis position per 1000N pressure and set it to the GUN PUSHING COEF.

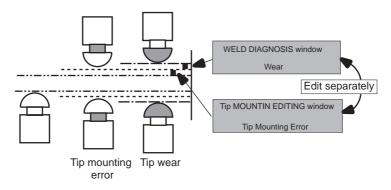

The GUN PUSHING COEFF. is set with [mm] unit.

- 9 Spot Welding Application Using a Motor Gun
- 9.8 Other Functions Using a Motor Gun

## 9.8.15 tip Mounting Control Function

The cause of the pressure position error when pressure is applied can be sorted to two causes; tip wear and tip mounting error.

By handling the cause separately, the real wear volume of tip itself can be handled to decide the ideal replacing timing.

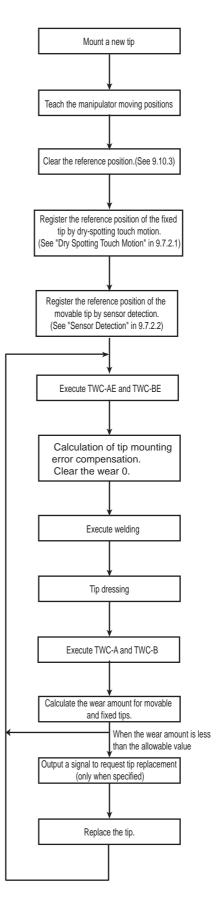

Spot and Arc Welding Using Motor Gun

9 Spot Welding Application Using a Motor Gun9.8 Other Functions Using a Motor Gun

\_\_\_\_\_

9.8.15.1 Tip Mounting Error Detection Flow Chart

9 Spot Welding Application Using a Motor Gun9.8 Other Functions Using a Motor Gun

This function is available while wear detection tag TWC-A and TWC-B, but not available while TWC-C is executed.

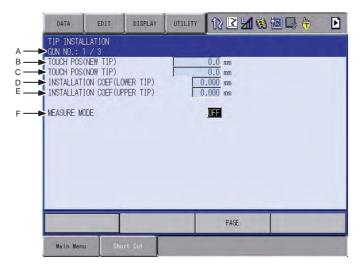

#### 9.8.15.2 Tip Installation

The error for electrode mounting is displayed.

MEASURE MODE which switches wear detection and tip mounting error detection operations can be set.

When MEASURE MODE is ON, the difference from the reference position is calculated as a tip mounting error.

#### Tip Installation Window

### A. GUN NO.

Shows the number of the gun.

Select a gun number by pressing the page key

#### **B. TOUCH POS (NEW TIP)**

The touch position while TWC-AE is executed (TWC-A is executed in MEASURE MODE) is indicated.

#### C. TOUCH POS (NOW TIP)

The touch position of TWC-A or TWC-AE (TWC-A is executed regardless of MEASURE MODE is ON or OFF) is indicated.

#### D. INSTALLATION COEF. (LOWER TIP)

Shows the current mounting error of fixed electrode.

#### F. INSTALLATION COEF. (UPPER TIP)

Shows the current mounting error of movable electrode.

#### **G. MEASURE MODE**

This mode is used for specifying the wear detection operation (TWC-C or TWC-B).

Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.8 Other Functions Using a Motor Gun

#### Operation

- 1. Select [SPOT WELDING] from the main menu.
- 2. Select [TIP INSTALLATION].

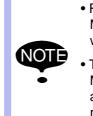

- TIP INSTALLATION window appears.

DATA	EDIT	DISPLAY	UTILITY	12 🗹 📶 📢	10 🕞 🔭	Þ
TIP INSTA GUN NO.:						
TOUCH POS TOUCH POS INSTALLAT	(NEW TIP)			0.0 mm 0.0 mm .000 mm		
MEASURE M	ODE			OFF		
-				PAGE	1	-

- 3. Select the gun number by pressing the [PAGE] key [ ].
- 4. Set [MEASURE MODE].
  - Move the cursor to ON or OFF. The ON/OFF mode alternate each time pressing the select button.
  - MEASURE MODE ON: The function is set for tip mounting error detection (TWC-AE or TWC-BE).
  - MEASURE MODE OFF: The function is set for wear detection (TWC-A or TWC-B).
  - Tip mounting error detection (TWC-AE or TWC-BE) functions when executing wear detection (TWC-A or TWC-B) at ON status. Accordingly, the difference from reference position which is indicated on the welding diagnosis window is calculated as a tip mounting error.

The wear is 0 cleared at this time.

9 Spot Welding Application Using a Motor Gun9.8 Other Functions Using a Motor Gun

- Right after mounting the tip, be sure to OFF the MEASURE MODE when executing wear detection job while MEASURE MODE is ON.
- The wear is handled as tip mounting error while MEASURE MODE is ON. So the wear is always regarded as 0 and the signals on wear (signal to request tip replacement, etc.) will not be output properly.

## 9.8.15.3 Tip Mounting Error Detection

The method to execute the tip mounting error detection operation by dry spotting touch motion and by plate touch motion is described here.

The following two methods are for detecting the tip mounting error.

This operation must be performed after the tip is mounted.

If this operation is executed with the worn tip, signals on wear (signal to request tip replacement, etc.) will not be output properly since the wear itself is regarded as the tip mounting error.

- ON the MEASURE MODE on Tip Mounting Control Display Apply this method when wear detection and tip mounting error detection are to be executed in the common job.
  - Dry spotting touch motion (TWC-A) Touch the fixed side and then, the movable side of the electrode to read the position.
     Execute SVGUNCL. instruction for dry spotting touch motion operation.

<Example>

MEASURE MODE:ON (Tip Mounting Control Display)

SVGUNCL GUN#(1) PRESSCL# (1)TWC-A

 Plate touch motion (TWC-B) Bring the movable side of the electrode into contact with a plate and read its position.
 Execute SVGUNCL. instruction for dry spotting touch motion operation.

#### 9.8.15.5 Monitoring tip Mounting Errors

The following parameters can monitor the tip mounting error.

- A1P56 : Electrode mounting error (absolute value) general output signal allocation
- A1P57 : Absolute value threshold of electrode mounting error (movable side) [µm]
- A1P58 : Absolute value threshold of electrode mounting error (fixed side)  $[\mu m]$

<Example>

A case when the value of the parameters are as follows.

AIP56=5, AIP57=1000 and AIP58=2000

The general output signal 5 is output when either of the following condition meets.

The absolute value of movable electrode mounting compensation

>= 1mm

The absolute value of fixed electrode mounting compensation

>= 2mm

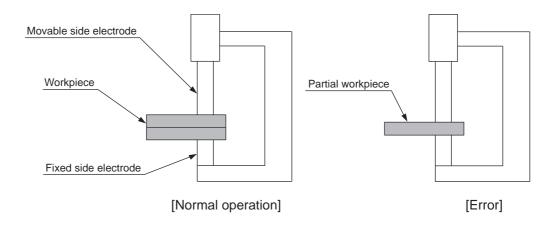

The signal is not output when the value of the general signal allocation parameter (A1P56) and both AIP57 and AIP58 are 0.

9.8.16	Workpiece Thickness Detection Function
Spot and Arc Welding Using Motor Gun	<ul><li>9 Spot Welding Application Using a Motor Gun</li><li>9.8 Other Functions Using a Motor Gun</li></ul>
163543-1CD	

#### 9.8.16.1 Outline

The workpiece thickness detection function monitors the thickness of workpiece to be welded every welding spot (hit point) at the SVSPOT instruction. This function does not, however, monitor the workpiece thickness when executing the SVGUNCL instruction.

An alarm occurs if the workpiece is missing.

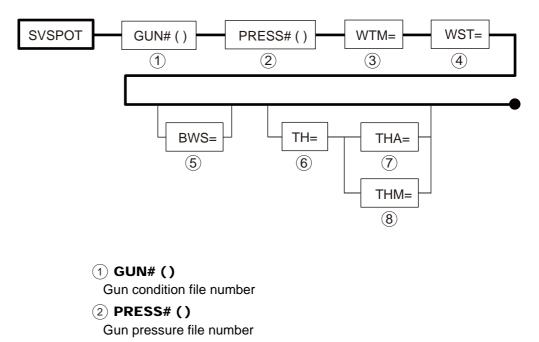

#### 9.8.16.2 Instruction

The workpiece thickness detection function is only available in the SVSPOT instruction but unavailable in the SVSPOTMOV instruction.

### SVSPOT (Spot Welding Instruction)

The SVSPOT instruction applies pressure to the gun and performs welding according to the specified welding condition number.

- 9 Spot Welding Application Using a Motor Gun
- 9.8 Other Functions Using a Motor Gun

## 3 WTM=

- Welding condition number
  - Specifies the welding condition number which is output to the power source.
- (4) WST=
  - Power source start signal output timing
    - Specifies the timing of output signal to start the power source.
    - Choose from the following three settings:
      - 1) Touch motion (WST=0)
      - 2) Pressure first time (WST=1)
      - 3) Pressure second time (WST=2)

## 5 BWS=

- Welding start gun stroke position
  - Specifies the stroke position to which the gun is opened at the execution of SVSPOT instruction.
  - Moves the gun to the position that has been adjusted according to the amount of electrode wear.
  - If the stroke position is not specified, starts the operation with speed control at the touch speed.
  - The gun operation speed is set by the gun condition file.

## 6 TH=

Workpiece thickness (unit: mm) (Can be set by constant numbers: -999.9 to 999.9 (the first decimal place is displayed).)

- In the thickness measure mode: the thickness value that has been measured at playback is written.
- In the monitoring mode: At playback, the "TH" value is compared with the measured workpiece thickness.

## 7) THA=

- Allowable ratio of workpiece thickness (unit: %, 0 to 100)
  - In the thickness measure mode: this condition is not used at the execution of SVSPOT instruction.
  - In the monitoring mode: this condition is used for the calculation of workpiece thickness comparison, and allows for variations in % for the specified workpiece thickness "TH".

## 8 THM=

Allowable workpiece thickness (unit: mm, 0.0 to 10.0)

- In the thickness measure mode: this condition is not used at the execution of SVSPOT instruction.
- In the monitoring mode: this condition is used for the calculation of workpiece thickness comparison, and allows for variations (from -THM to +THM) for the specified workpiece thickness "TH".

- 3. Select {THICKNESS MEASURE} under {UTILITY}.

 "Thickness measure mode" appears in the message display area. The [THICKNESS MEASURE] key is displayed with an asterisk.

- General signal can be used to switch to the thickness measure mode.
  - When using the general signal to switch to the thickness measure mode, set the following parameter.
     S4C522: Specifies the general input signal to switch to the thickness measure mode

0: Switches to the thickness measure mode by using the programming pendant.

- Note that when S4C522 is not 0, it is impossible to switch to the thickness measure mode by using the programming pendant.
- While above general signal is input, to switch again to the thickness measure mode after the mode is canceled by one of the operations described in *"How to Cancel Thickness Measure Mode" on page 9-94*, turn off then on the general signal.
- 4. Execute the job.

163543-1CD	
Spot and Arc Welding Using Motor Gun	<ul><li>9 Spot Welding Application Using a Motor Gun</li><li>9.8 Other Functions Using a Motor Gun</li></ul>
	<ul> <li>The "TH" tag value of SVSPOT instruction will be rewritten with th workpiece thickness, the value when the pressure reaches the tour pressure, at each hit point.</li> <li>The following formula is used to calculate the "TH" value.</li> </ul>
	TH= Touch pressure position (Pulse-to-stroke conversion value, mm) *1 + DMF (Fixed side wear amount + Movable side wear amou
	mm) + BZ (Gun bending compensation coefficient (Z-direction × Touch pressure, mm) *1
	*1: Refer to the gun condition file.
	<ul> <li>The following parameter can decide whether to consider the gun bending compensation coefficient or not when measuring or monitoring workpiece thickness.</li> </ul>
	A1P59: Whether to consider the gun bend compensation coefficient or not when detecting workpiece thickness 0: Not consider

- 1: Consider
- Do not change the above parameter between when measuring and when monitoring. Detection cannot be performed properly.

### Execution of Workpiece Thickness Monitoring

Set the mode switch of programming pendant to the Play mode.
 Cancel the thickness measure mode.
 \* Refer to *"How to Cancel Thickness Measure Mode" on page 9-94.*

If playback of a job is performed with the thickness measure mode canceled, the workpiece thickness measured at each hit point is compared with the value of "TH", "THA", or "THM" tag.

If the comparison result is not acceptable, the alarm "Thickness Error" occurs.

Use the following formula for comparison.

For THM tag:

[Acceptable Result]

TH - THM  $\leq$  Touch pressure position + DMF + BZ  $\leq$  TH + THM

[Not-Acceptable Result]

TH - THM > Touch pressure position + DMF + BZ

9 Spot Welding Application Using a Motor Gun

9.8 Other Functions Using a Motor Gun

#### Or

Touch pressure position + DMF + BZ > TH + THM

For THA tag:

[Acceptable Result]

TH - (TH  $\times$  THA / 100)  $\leq$  Touch pressure position + DMF + BZ  $\leq$  TH + (TH  $\times$  THA / 100)

[Not-Acceptable Result]

TH - (TH  $\times$  THA / 100) > Touch pressure position + DMF + BZ Or

Touch pressure position + DMF + BZ > TH + (TH  $\times$  THA / 100)

#### 9.8.16.4 Related Functions

#### I/O Output at Thickness Measure Mode

In the thickness measure mode, "1" is output to the general output that has been stored in the parameter "S4C168". For example, if the parameter S4C168 is 20 (S4C168=20), "1" is output to "OUT20".

This parameter can be used to stop welding in the thickness measure mode.

#### Canceling Thickness Monitoring

While the general input signal specified to the following parameter is input, the workpiece thickness monitoring function is canceled, and the same operation is performed as when the TH tag is unused.

S4C523: Cancels workpiece thickness monitoring

0: Not used

1 to 2048: When the specified general signal is input, the workpiece thickness monitoring function is canceled.

- Display of Measured Thickness
  - The measured thickness is displayed in mm on the "SPOT WELD DIAGNOSIS" window.

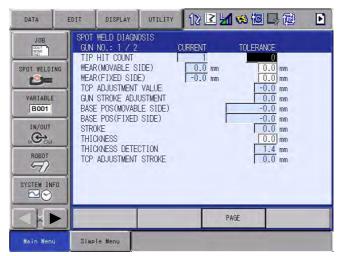

- The latest measured thickness is always displayed on the window.
- Even if the power to the controller is turned OFF, the measured thickness value will remain.

Spot and Arc Welding Using Motor Gun

- 9 Spot Welding Application Using a Motor Gun
- 9.8 Other Functions Using a Motor Gun
- 1. Select {SPOT WELDING} under the main menu, then select {WELD DIAGNOSIS}.

- The SPOT WELD DIAGNOSIS window appears.

### How to Cancel Thickness Measure Mode

- 1. Cancel the thickness measure mode, then switch to the monitoring mode.
  - Performing one of the following operations cancels the thickness measure mode and switches to the monitoring mode:
    - 1) END operation at Playback
    - 2) Switching to Teach Mode
    - 3) Canceling [THICKNESS MEASURE] from the menu

- 9 Spot Welding Application Using a Motor Gun
- 9.9 I/O Signals for a Motor Gun

9.8.16.5 Notes

1. After a series of teaching operations, it is recommended that the "TH" tag of SVSPOT instruction be specified immediately before thickness measurement.

If the "TH" tag is specified before that, the alarm "Thickness Error" may occur during test operation, which results in less operating efficiency.

 The value of measured workpiece thickness is affected by the delay of measurement timing and gun bend at the touch motion. Therefore, an absolute accuracy cannot be guaranteed. The faster the touch speed becomes and the more the touch pressure

increases, the bigger the error will be. If the pressure specified in the thickness measure mode is equal to that of the monitoring mode, the absolute accuracy will be approximately 1 mm or less.

3. The value of measured workpiece thickness is calculated as follows: finding the touch motion position by using the pulse value at touch motion according to the pulse-to-stroke conversion table registered in the gun condition file, then adding the total wear amount to the touch motion position.

Thus, the value is affected by the previous information registered in the gun condition file.

Value of measured workpiece thickness

- = Touch motion position + Total wear amount
- + Gun bending compensation coefficient (Z-direction)
- $\times$  Touch pressure

# 9.9 I/O Signals for a Motor Gun

### Spot and Arc Welding Using Motor Gun

9 Spot Welding Application Using a Motor Gun 9.10 System Setting

#### Gun Condition Window

#### A. GUN NO.

Shows the No. of the gun to be used.

When using two guns or more, select the No. by pressing the page key

#### B. SETTING

Shows whether the gun condition file has been set or not. For the file where the values have not been entered, "NOT DONE" appears, while for the file where the values have already been entered, "DONE" appears.

#### C. GUN TYPE

Shows the gun type. Select from "C-GUN", "X-GUN (SINGLE ARM MOVE)" and "X-GUN (DOUBLE ARM MOVE)".

#### D. POWER SOURCE NO.

Shows the No. of the connected Power Source.

#### E. TORQUE DIR

Specifies the pressure direction of the gun axis motor. When the direction to increment the motor encoder value and the pressure direction of the gun are the same, select "+". When they are different, select "-".

- 9 Spot Welding Application Using a Motor Gun
- 9.10 System Setting

#### F. PULSE, STROKE

Shows the relationship between the encoder pulse value of the gun axis motor and the gun stroke. The pulse value for the specified gun stroke can be calculated by interpolation of these values.

#### G. TORQUE, PRESSURE

Shows the relationship between the gun axis motor torque and the electrode pressure. The torque value for the specified pressure can be calculated by interpolation of these values.

#### **H. MAX PRESSURE**

Enter the maximum pressure that the gun can apply. If the value specified by the pressure file exceeds it, an alarm occurs when accelerated.

#### I. TOUCH DETECTIVE DELAY TIME

Shows the delay time from the start of the touch motion to the start of the touch motion detection for the SVSPOT and SVGUNCL instruction.

#### J. TOUCH SPEED THRESHOLD

Shows the gun axis motor speed to detect that the pressure reaches the touch pressure for SVSPOT and SVGUNCL instruction.

#### K. WEAR DETECTIVE SENSOR DIN NO.

Shows the direct IN No. where the signal from the sensor to be used for wear detection is input.

#### L. WEAR RATIO (FIXED SIDE)

Shows the fixed side electrode wear ratio to the total wear amount detected in the wear detection operation.

#### **M. FIXED OFFSET**

Shows the fixed side electrode shift amount executed at the time of the wear compensation. Substitute the value when the fixed side electrode is to be shifted in one direction at spot welding.

#### N. WEAR DETECT SENSOR POLARITY

Shows the polarity of the signal from the sensor used for the wear detection.

"ON  $\rightarrow$  OFF": Normally ON. OFF when the electrode reaches the sensor. "OFF  $\rightarrow$  ON": Normally OFF. ON when the electrode reaches the sensor.

#### O. MOVEMENT RATIO AFTER CLOSE (LOW) (displayed only when "X-GUN (DOUBLE ARM MOVE)" is selected)

Shows the lower electrode movement ratio when the gun closes more by the electrode wear. Enter 60% when the ratio of upper electrode movement: the lower electrode movement = 4:6.

#### P. MOVEMENT RATIO IN SENSING (UP) (displayed only when "X-GUN (DOUBLE ARM MOVE)" is selected)

Shows the ratio when the upper side electrode passes the sensor, for detecting the upper side electrode wear using a sensor. Enter 70% when the ratio of the upper side electrode movement: the lower side electrode movement = 7:3.

#### Q. STROKE MOVING VELOCITY

Specify the motion velocity of welding start stroke, etc (BWS specified value) when welding instruction (SVSPOT instruction) is executed. Refer to Section 9.8.14 "Setting the Gun Pushing Coefficient" on page 9-75 for the details.

#### R. GUN ARM BEND COEF.

Set the gun arm bend compensation volume over the pressure of 1000N.

Refer to Section 9.8.13 "Gun Stroke Setting for Welding Start" on page 9-73 for the details.

163543-1CD	
Spot and Arc Welding Using Motor Gun	<ul><li>9 Spot Welding Application Using a Motor Gun</li><li>9.10 System Setting</li></ul>
	S. PRESSURE COMPENSATION When applying pressure upwards, set the difference of pressure between that of downwards.
	Refer to Section 9.8.8 "Gun Pressure Compensation Function" on page 9-55 for the details.
	T. RESET WEAR OF LOWER TIP Set "WEAR(FIXED SIDE) CURRENT VALUE" on SPOT WELD DIAGNOSYS window to 0 by the specified user input.
	U. RESET WEAR OF UPPER TIP Set "WEAR(MOVABLE SIDE) CURRENT VALUE" on SPOT WELD DIAGNOSYS window to 0 by the specified user input.
	V. GUN PUSHING COEF Set the gun axis pushing volume per 1000N. Refer to Section 9.8.15 "tip Mounting Control Function" on page 9-77 for
	the details. W. LIMIT OF TOUCH (LOWER TIP)
	Set the fixed electrode allowable range for touch motion detection position when pressurizing. X. LIMIT OF TOUCH (UPPER TIP)
	Set the movable electrode allowable range for touch motion detection position when pressurizing. Y. DRY SPOT (FILE)
	Execute dry spotting by the specified user input. Pressure is released after pressurized at the pressure position which is specified by a file in accordance with the dry spotting pressure file
	Z. DRY SPOT (CONTINUE)
	Execute dry spotting by the specified user input. Pressure follows the dry spotting pressure file which is specified by the DRY SPOT FILE NO.
	Pressurizes when the signal is ON and releases when it is OFF. <b>a. DRY SPOT FILE NO.</b>
	Specifies the dry spotting file no. used when forced gun-pressurizing. <b>b. TIP HIT COUNT RESET</b> Clears the tip hit count by the specified user input.
	<ul> <li>c. WEAR VOLUME OVER (FIXED)</li> <li>ON the specified user input when "WEAR(FIXED SIDE) CURRENT VALUE" exceeds the "FIXED ELECTRODE ALLOWABLE RANGE" after the measurement of wear.</li> <li>d. WEAR VOLUME OVER (MOVABLE)</li> </ul>
	d. WEAR VOLUME OVER (MOVABLE) ON the specified user input when "WEAR(MOVABLE SIDE) CURRENT VALUE" exceeds the "MOVABLE ELECTRODE ALLOWABLE" RANGE after the measurement of wear.
	e. HIT POINT COUNT OVER By the SVSPOT instruction, ON the specified user input when "HIT POINT CURRENT VALUE" exceeds the "HIT POINT ALLOWABLE" RANGE.

- 9 Spot Welding Application Using a Motor Gun
- 9.10 System Setting
- 9.10.1.1 Entering Pulse to Stroke Conversion Data

To specify the gun stroke in mm, enter data about the relationship between the gun axis motor encoder pulse value and the gun stroke (mm).

Follow the procedures explained below.

Up to 8 items of data can be entered.

- 1. Set the applicable gun stroke by a jog operation with the programming pendant.
  - Read the pulse value of the gun axis motor encoder on the programming pendant.
- 2. Repeat the steps 1 for 8 points in total.
  - When the relationship between two values are known from the machine drawing, calculate the data for the 8 points.
- 3. Enter the obtained data of 8 points in "PULSE" and "STROKE" in the gun condition file.
- 9.10.1.2 Entering Torque to Pressure Conversion Data

To specify the pressure in N, enter data about the relationship between the gun axis motor torque (%) and the pressure (N).

Follow the procedures explained below.

Up to 8 items of data can be entered.

- 1. Set the pressure in the dry spotting pressure file.
  - Specify the pressure units as "Torque (%)".
- 2. Register SVGUNCL instruction in a job.
  - Specify the dry spotting pressure file set in step 1.
- 3. Execute the job and measure the gun pressure with a pressure gauge.
- 4. Repeat steps 1. to 3. with a different pressure each time to obtain 8 items of data for the torque and the pressure.
- 5. Enter the obtained data of 8 points in "TORQUE" and "PRESSURE" in the gun condition file.

When the gun condition file has not been set, the pressure cannot be applied.

When applying the pressure for the first time, set any value in the gun condition file.

163543-1CD

#### 9.10.4 Setting the Software Limit Value

For motor guns, the position where the new electrodes touch each other is set as the zero-point (pulse = 0), and the pulse software limit is set on this zero-point position.

When correcting the position for the compensation of the detected amount of electrode wear, modifying the pulse soft limit value is necessary because the gun is closed more than the zero-position.

<Setting Example>

The touch position of new electrodes is set as the zero-point.

When electrodes are worn out, they do not reach the touch position (zero-point.)

Modify the software limit value so that the electrodes reach the touch

position.

Parameters

S1CxG400: Pulse software limit (+ side)

S1CxG408: Pulse software limit (- side)

<Example>

When S1CxG400=50000 and S1CxG408=0:

The motor gun moves in the range 0 to 50,000 pulses.

To move the electrodes to the touch position when the electrodes are worn out, set -3,000 for S1CxG408 so that the motor gun moves in the range -3,000 to 50,000 pulses.

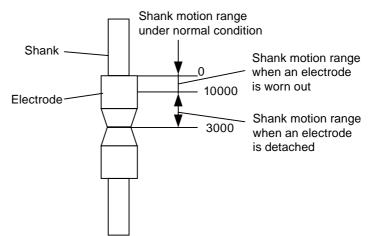

When setting the value for S1CxG408, consider the pulse amount equivalent to the total of maximum wear amounts of two electrodes and the gun axis bend when maximum gun pressure is applied.

163543-1CD	
Spot and Arc Welding	9 Spot Welding Application Using a Motor Gun
Using Motor Gun	9.10 System Setting

#### 9.10.5 Setting the Lost-electrode Detection Value

The gun-axis pulse can be monitored to output the signal when an electrode of motor gun is detached.

<Setting Example>

The signal is output when the shank moves out of its normal motion range because an electrode is detached.

#### Parameters

S2C003=10 (S1 (gun-axis) uses Interference 1.)

S2C067=0 (Monitors pulses.)

S3C664=3000, S3C072=10000 (The signal is output in the range of 3000 to 10000.)

#### 10.3 Function Keys

Each function used for spot welding is allocated on the Numeric keys of the programming pendant.

1 COMPLETE TIMER	Registers a timer instruction "TIMER" in a job.
O MANUAL SPOT REFP	Registers a reference point "REFP" in a job, or modifies the registered reference point. [REFP] + [FWD] Moves the manipulator to the registered reference point.
8 PRESSURE ARCON	Registers a welding start instruction "ARCON".
5 MOTION O ARCOFF	Registers a welding end instruction "ARCOFF".

# Spot and Arc Welding Using Motor Gun

10 Arc Welding Application10.3 Function Keys

2 CLOSE GAS	Use this key to control the gas flow. Gas is fed only while [GAS] is pressed. (Refer to Section 10.3.3 "Gas Flow Control Function" on page 10-9.)
9 RELEASE FEED 6 ALMRST RETRACT	Used for wire inching. Press [FEED] to feed the wire, and press [RETRACT] to retract the wire. While these keys are pressed, the wire feed motor operates. Three speed levels are available for wire feeding: [FEED]: Slow [FEED] + [FAST]: Medium [FEED] + [FAST]: Medium [FEED] + [HIGH SPEED]: Fast Two speed levels are available for wire retraction: [RETRACT]: Slow [RETRACT] + [HIGH SPEED]: Fast (Refer to Section 10.3.2 "Wire Inching Function" on page 10-8.)
3 FULL OPEN CUR/VCL↑ - SHORT OPEN CUR/VCL↓	Modifies the welding current/voltage while welding during the play mode. Press [3/CUR/VOL] to increase the current/voltage value, and press [–/CUR/VOL] to decrease the current/ voltage value. (Refer to Section 10.13 "Changing Welding Conditions During Playback" on page 10-107.)
4 smov	When the security mode is the management mode, press this key to light the LED and welding can be performed during the test run. Use this key for welding check during teaching. * When [WELD ON/OFF] is pressed and the LED is lit, a beep is sounded.
Zynchro Single	Changes the type of movement for the manipulator when teaching a coordinated job. Each time this key is pressed, the movement type changes. SYNCRO: The mark for "synchronized" appears in the
	status display area. When the master side is moved, the slave side will follow the movement of the master. SINGLE: Only the selected group axis moves.

Wire retraction, high-speed inching, or high-speed retraction cannot be performed depending on the Power Source.
 The function key is not available if the window (subject of key operation) is active while arc start cond. or arc end

cond.window is displayed.

10 Arc Welding Application10.3 Function Keys

#### **10.3.1** Switching of the Function Key

Function keys can be switched between for spot welding (motor gun) use and for arc welding use by following the procedures below:

#### 10.3.1.1 Two-Robot System

- Select a robot job for SPOT welding (motor gun). (CONTROL GROUP: R1 + S1)
  - Keys change for spot welding (motor gun) use automatically. {ARC/SPOT} icon on the main menu changes to {SPOT}.

- 10.3 Function Keys
- 4. Select {ARC WELD}.

Move the cursor to {ARC WELD} and press [SELECT], then the function keys become valid for ARC welding use. {ARC/SPOT} icon on the main menu changes to {ARC}.

#### 10.3.2 Wire Inching Function

#### Wire Inching

The term wire inching refers to gradually feeding or retracting the welding wire through the torch. [FEED] and [RETRACT] are used to perform wire inching. The wire inching simply feeds or retracts the wire, it has nothing to do with the job procedure being taught. The wire inching is performed only in the teach mode when the arc does not occur.

#### Wire Feeding

The wire is fed only while [FEED] is pressed.

Three speed levels are available for wire feeding:

[FEED]: Slow

[FEED] + [FAST]: Medium

[FEED] + [HIGH SPEED]: Fast

Spot and Arc Welding Using Motor Gun

10 Arc Welding Application10.4 Power Source Condition File

#### Wire Retraction

The wire is retracted only while [RETRACT] is pressed.

Two speed levels are available for wire retraction:

[RETRACT]: Slow

[RETRACT] + [HIGH SPEED]: Fast

Wire retraction, high-speed inching, or high-speed retraction cannot be performed depending on the Power Source.

#### 10.3.3 Gas Flow Control Function

Gas Flow Control

The Gas Flow Control function is used to adjust the flow amount of shielding gas by opening or closing the solenoid valve.

The solenoid valve can be opened or closed by pressing [GAS].

This function simply opens or closes the solenoid valve for shielding gas. Therefore, the operation does not cause any changes in the job contents.

The Gas Flow Control function is enabled in the teach mode only.

#### **10.4** Power Source Condition File

#### 10.4.1 About Power Source Condition File

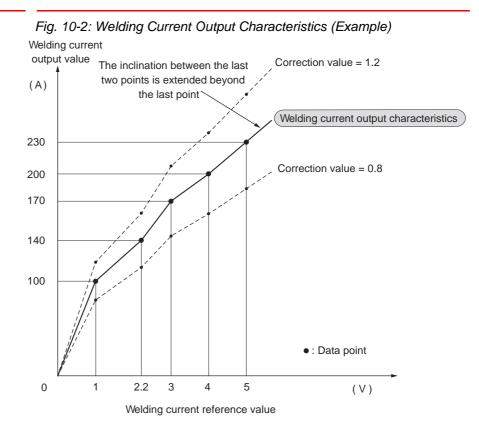

This is the file where the Power Source characteristics: voltage characteristic, etc., is registered. This file contains the information for Power Source control.

For precise control of the welding current and voltage, the control signals sent from the controller to the Power Source must be properly adjusted.

The voltage of the current control signal is called the welding current reference value; the voltage of the voltage control signal is called the welding voltage reference value. A reference value is in the range between 0 and 14V (or between 0 and -14 depending on Power Sources).

How the output of the welding current or voltage changes with the reference value depends on the Power Source model, and this relationship between the reference value and output value is called an output characteristics. Each Power Source condition data file contains the output values (measured values) associated with several reference values. The figure below is an example of the welding current output characteristic curve.

- 10 Arc Welding Application
- 10.4 Power Source Condition File

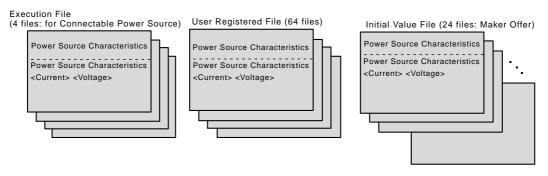

Note that the data points (points of measurement) are automatically connected by straight lines, which define the output values of any points off these data points.

The inclination between the last two data points is extended as a straight line beyond the last point until it reaches the end of the measuring range.

If the intended welding current or voltage is not output due to a fluctuation in the Power Source's power supply voltage, adjust the output by specifying a correction value. The figure (*Fig.10-2 Welding Current Output Characteristics (Example)*) shows how a correction value works.

The following are the three types of the Power Source condition files. Each file consists of two windows.

Fig. 10-3: Power Source Condition Files

- The execution file is used to set the condition file of the Power Source being used.
- The user registered file is used by the user to save the Power Source condition files, and the data for 64 models can be registered.

- Arc Welding Application
   Power Source Condition File
  - Yaskawa also offers initial value files which contain common Power Source characteristics. Data for 24 models have already been registered.

A Power Source condition file can be set only by reading from either the user registered file or initial value file to the execution file.

When it is necessary to make adjustments to the data, refer to Section 10.4.4 "Editing the Power Source Condition Files" on page 10-14.

#### 10.4.2 Specifying Welding Voltage when Synergic Power Supply is Used

When a synergic power supply is used, the DX100 requests the user to specify the welding voltage by a ratio against the proper output value (not by the output value as conventionally done).

For that, the voltage characteristics associated with a certain welding current output value must be determined by measurement, and the results should be stored in the Power Source condition data file as representative values.

The welding current output value for the measurement should be a value that is assumed relatively often in actual situations.

Each of the provided Power Source condition data files already contains the representative values for the associated Power Source model.

#### <Example>

An example is shown with the ARCON instruction.

If the welding current output is 250A, the welding voltage can be specified as follows:

ARCON	AC=250	AVP=100
	Welding current 250A	100% of proper output, assuming the use of synergic power supply.

With the voltage characteristics with the following Figure A, <u>the above</u> instruction causes the output of 7.5V control signal to the Power Source

If the welding current output value is changed to 220A, a minor correction to the ARCON instruction causes the output of the control signal associated with 100% of the proper output value at 220A. (Fig.B)

ARCONAC=220AVP=100.....100% output

Also note that a minor adjustment of the welding voltage can be instructed easily. (Fig.C)

e.g. The control signal is output 110% of the proper output value at 220A.

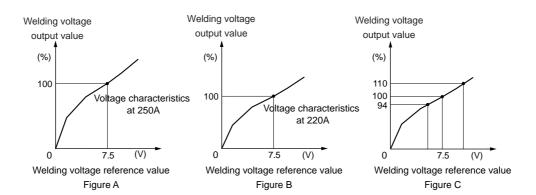

ARCON	AC=220	AVP=110	·····110% output

or

e.g. The control signal is output 94% of the proper output value at 220A.

ARCON AC=220 AVP=94 .....94% output

10 Arc Welding Application10.4 Power Source Condition File

This setting method enables easy adjustment without calculating the voltage output.

This method can be also applied to condition data files and instructions other than ARCON.

Another advantage is that a single welding job can be used with more than one Power Source with a synergic power supply by changing the welder condition data file.

If welding current output is significantly different from the voltage characteristics measurement used, voltage output may vary. Write the welding current value used for the voltage characteristics measurement as a comment for reference.

- 10 Arc Welding Application10.4 Power Source Condition File
- \_\_\_\_

#### 10.4.3 POWER SOURCE CONDITION File

A Power Source condition data file has the following two windows:

- POWER SOURCE CONDITION Window
- POWER SOURCE CONDITION Window (for current/voltage output)

#### 10.4.3.1 POWER SOURCE CONDITION Window

۹	POWER SOURCE CONDITION POWER SOURCE NO.: 1/1
	SETTING       : DONE         POWER SOURCE NAME       : MOTOWELD-E350         COMM.       : STC CONTROL NONE         POWER SUPPLY       : A <sup>10</sup> / <sub>6</sub> SHIELDING GAS       : CO2         WIRE DIA.       : 0.1 mm         WIRE STICKOUT       : 15 mm         WIRE ANTI-STICKING       : 0.1 sec         ARC FAILURE STOP       : 1.50 sec
	Main Menu Simple Menu ITurn on servo power

#### A. POWER SOURCE NO. (1 to 8)

Displays a Power Source number between 1 and 8 (for each welder). **B. SETTING** 

If this file is modified, the status automatically changes to "NONE," indicating that the modification is not saved yet. To save the modification to the file, move the cursor to "SETTING" and press [SELECT]. Then the status changes to "DONE".

#### C. POWER SOURCE NAME

Displays a Power Source name of 16 characters or less.

#### D. COMM. (COMMENT)

Displays a comment of 32 characters or less.

#### E. POWER SUPPLY (A/V, A/%)

- When "A/%" is displayed: Measured values of voltage can be input by the unit of "%" for "D. MEASURE" in the POWER SOURCE CONDITION window for current/voltage output shown in the next page.
- When "A/V" is displayed: Measured values of voltage can be input by the unit of "V" for "D. MEASURE" in the POWER SOURCE CONDITION window for current/voltage output shown in the next page.

\*To switch between "A/%" and "A/V" in the POWER SOURCE CONDITION window, select [DATA] -> [READING] to read the initial value file (maker offer) or user registered file once again.

\*This function is available for the standard software version NS4.00.00A ( $\Box$ )-00 or later.

#### F. SHIELDING GAS (CO2,MAG)

Specifies the shielding gas type.

Spot and Arc Welding Using Motor Gun	<ul><li>10 Arc Welding Application</li><li>10.4 Power Source Condition File</li></ul>					
	<ul> <li>G. WIRE DIA. (0 to 9.9 mmΦ) Specifies the wire diameter.</li> <li>H. WIRE STICKOUT (0 to 99 mm) Specifies the length of the welding wire protruding from the torch tip.</li> <li>I. WIRE ANTI-STICKING (0 to 9.9 seconds) Specifies the duration of the wire anti-stick process at the end of</li> </ul>					

- J. ARC FAILURE STOP (0 to 2.55 seconds) Specifies the time between the detection of arc failure and the stopping of the manipulator movement.
- 10.4.3.2 POWER SOURCE CONDITION Window for Current/Voltage Output

#### 10.5.1 ARCON

#### 10.5.1.1 Function

This instruction outputs an arc start command.

The arc start signal to the Power Source is turned ON to start welding by this instruction.

The function key [ARCON] can be used for registration.

Function key to register the welding start instruction (ARCON)

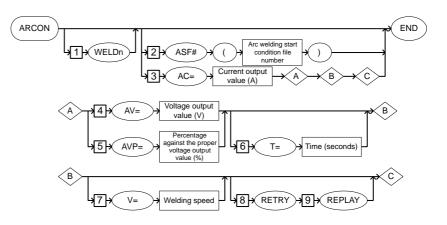

10 Arc Welding Application10.5 Basic Functions

To register the ARCON instruction using [INFORM LIST], select "DEVICE" from the instruction group list.

#### 10.5.1.2 Syntax

#### 10.5.1.3 Explanation

#### WELDn [1]

Choose one of the following tags.

These tags are enabled only when multiple applications are in use and two or more applications are set as arc welding application.

When there is only one application, these tags are not displayed.

Тад	Explanation	Note
WELDn	Selects the Power Source 1 to 8.	

#### ASF# (Arc welding start condition file number) [2] /AC = Current output value [3]

Be sure to choose either of the following.

Tag	Explanation	Note
ASF# (Arc welding start condition file number)	Specifies the arc welding start condition file number. Conditions to start welding are registered in the arc welding start condition file.	No. 1 to 1000 The number can be specified by B/I/D/LB/LI/ LD variable.
AC = Current output value	Specifies the output value of welding current.	Current value: 1 to 999 A The current output value can be specified by B/I/D/ B[]/I[]/D[]/LB/LI/LD/LB[]/ LI[]/LD[] variable.

### Spot and Arc Welding Using Motor Gun

10 Arc Welding Application

#### 10.5 Basic Functions

### AV = Voltage output value /AVP [4] = Percentage against the proper voltage output value [5]

Only when "AC = Current output value" is selected in the above "ASF# (Arc welding start condition file number) [2] /AC = Current output value [3]", be sure to choose either of the following.

Тад	Explanation	Note
AV = Voltage output value	Specifies the output value of welding voltage. The output value of welding voltage is specified when the power supply is independent.	Voltage value: 0.1 to 50.0 V The voltage output value can be specified by B/I/D/ B[]/I[]/D[]/LB/LI/LD/LB[]/ LI[]/LD[] variable. (Unit: 0.1 V)
AVP = Percentage against the proper voltage output value	Specifies the percentage against the proper output value of welding voltage. The percentage against the proper voltage output value is specified when the power supply is synergic.	Percentage: 50 to 150% The voltage output value can be specified by B/I/D/ B[]/I[]/D[]/LB/LI/LD/LB[]/ LI[]/LD[] variable.

#### T = Time [6]

This tag is added or omitted only when "AC = Current output value" is selected in the above "ASF# (Arc welding start condition file number) [2] / AC = Current output value [3]".

Tag	Explanation	Note
T =Time	Specifies the timer value at the start of welding.	Unit: seconds The time can be specified by I/LI/I[]/LI[] variable. (Unit: 0.01 sec.)

#### ■ V = Welding speed [7]

This tag is added or omitted only when "AC = Current output value" is selected in the aforementioned "ASF# (Arc welding start condition file number) [2] /AC = Current output value [3]".

Tag	Explanation	Note
V = Welding speed	Specifies the welding speed.	Speed: 0.1 to 1500.0 mm/sec. The unit displayed can be changed by the setting of the parameter (S2C101). The speed can be specified by B/B[]/LB/LB[ ]/l/l[]/LI/LI[]/D/D[]/LD/LD[ ] variable. (Unit: 0.1 mm/sec.)

## 10 Arc Welding Application

10.5 Basic Functions

#### RETRY [8]

This tag is added or omitted only when "AC = Current output value" is selected in the aforementioned "ASF# (Arc welding start condition file number) [2] /AC = Current output value [3]".

Тад	Explanation	Note
RETRY	Specifies the retry function. The retry function works to prevent the interruption of operation when an arc start failure occurs.	Refer to Section 10.6 "Arc Retry Function" on page 10-63.

### REPLAY [9]

Only when RETRY is added in the above "RETRY [8]", be sure to add this tag.

Тад	Explanation	Note
REPLAY	Specifies the replay mode. The replay mode is one of the modes to repeat the ARCON process when the retry function is enabled.	Refer to Section 10.6 "Arc Retry Function" on page 10-63.

#### 10.5.1.4 Registering the ARCON Instruction

- 1. Press [ARCON].
- 2. Press [ENTER].

ARCON instruction cannot be modified after it is registered to the job.

(Refer to Section 3.6.4 "Modifying Instructions" on page 3-52.)

If the ARCON instruction needs to be modified, delete it and then, add the necessary instruction.

#### 10.5.1.5 Setting Welding Start Conditions

The ARCON instruction can be registered in any of the following three ways:

- With additional items to specify conditions ARCON AC=200 AVP=100 T=0.50 V=60 RETRY
- With an arc welding start condition file ARCON ASF# (1) In this case, the welding condition is set using the arc welding start condition file. (Refer to Section 10.5.4 "Arc Start Condition File" on page 10-48.)
- Without additional items ARCON In this case, the welding condition must be set using the welding condition set instruction (ARCSET) before the ARCON instruction is executed. (Refer to Section 10.5.3 "ARCSET" on page 10-41.)

Spot and Arc Welding Using Motor Gun

#### 10.5.2 ARCOF

#### 10.5.2.1 Function

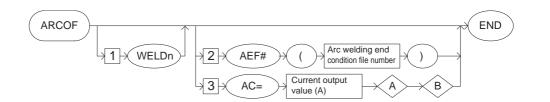

This instruction outputs an arc end command.

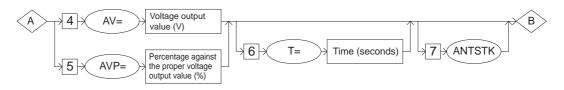

The arc start signal to the Power Source is turned OFF to end welding by this instruction.

The function key [ARCOF] can be used for registration.

#### 10.5.2.2 Syntax

#### 10.5.2.3 Explanation

#### WELDn [1]

Choose one of the following tags.

These tags are enabled only when multiple applications are in use and two or more applications are set as arc welding application.

When there is only one application, these tags are not displayed.

Тад	Explanation	Note
WELDn	Selects the Power Source 1 to 8.	

#### AEF# (Arc welding end condition file number) [2] /AC = Current output value [3]

Be sure to choose either of the following.

Тад	Explanation	Note
AEF# (Arc welding end condition file number)	Specifies the arc welding end condition file number. Conditions to end welding are registered in the arc welding end condition file.	No. 1 to 1000 The number can be specified by B/I/D/LB/LI/ LD variable.
AC = Current output value	Specifies the output value of welding current.	Current value: 1 to 999 A The current output value can be specified by B/I/D/ B[]/I[]/D[]/LB/LI/LD/LB[]/ LI[]/LD[] variable.

- 10 Arc Welding Application10.5 Basic Functions
- AV = Voltage output value /AVP [4] = Percentage against the proper voltage output value [5]

Only when "AC = Current output value" is selected in the above "AEF# (Arc welding end condition file number) [2] /AC = Current output value [3]", be sure to choose either of the following.

Тад	Explanation	Note
AV = Voltage output value	Specifies the output value of welding voltage. The output value of welding voltage is specified when the power supply is independent.	Voltage value: 0.1 to 50.0 V The voltage output value can be specified by B/I/D/ B[]/I[]/D[]/LB/LI/LD/LB[]/ LI[]/LD[] variable. (Unit: 0.1 V)
AVP = Percentage against the proper voltage output value	Specifies the percentage against the proper output value of welding voltage. The percentage against the proper voltage output value is specified when the power supply is synergic.	Percentage: 50 to 150% The voltage output value can be specified by B/I/D/ B[]/I[]/D[]/LB/LI/LD/LB[]/ LI[]/LD[] variable.

### T = Time [6]

This tag is added or omitted only when "AC = Current output value" is selected in the above "AEF# (Arc welding end condition file number) [2] / AC = Current output value [3]".

Tag	Explanation	Note
T =Time	Specifies the timer value at the end of welding.	Unit: seconds The time can be specified by I/LI/[]/LI[] variable. (Unit: 0.01 sec.)

### ANTSTK [7]

This tag is added or omitted only when "AC = Current output value" is selected in the aforementioned "AEF# (Arc welding end condition file number) [2] /AC = Current output value [3]".

Tag	Explanation	Note
ANTSTK	Specifies the automatic wire- stick release function. When the automatic wire-stick release function is used, the manipulator does not immediately output the wire sticking signal upon detecting a wire stick, but automatically attempts to release the sticking by applying a certain voltage.	Refer to Section 10.8 "Automatic Wire-stick Release Function" on page 10-68.

10.5.2.5 Setting Arc Welding End Conditions (Crater Processing)

The ARCOF instruction can be registered in any of the following four ways:

- With additional items to specify conditions ARCOF AC=160 AVP=70 T=0.50 ANTSTK
- With an arc welding end condition file ARCOF AEF#(1) In this case, the welding condition is set using the arc welding end condition file. (Refer to Section 10.5.5 "Arc End Condition File" on page 10-54.)

- 10 Arc Welding Application10.5 Basic Functions
  - Without additional items
     ARCOF

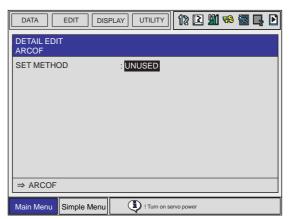

When the crater process is performed by changing the welding condition when welding is completed, before the ARCOF instruction is executed, the welding condition needs to be set using the welding condition setting instruction. (Refer to *Section 10.5.3 "ARCSET" on page 10-41*.)

#### With Additional Items to Specify Conditions

- 1. Select the ARCOF instruction in the instruction area.
  - The ARCOF instruction appears in the input buffer line.

		10.5.3	ARCSET	
10.5.3.1	Function			
			This is the instruction to set the welding conditions (current, voltage, etc.) individually.	
			The ARCSET instruction can be registered in any of the following two ways:	
			<ul> <li>With additional items to specify conditions ARCSET AC=200 AVP=100</li> </ul>	
			<ul> <li>With an arc welding start condition file ARCSET ASF# (1) In this case, the welding condition is set using the arc start condition file.</li> </ul>	

(Refer to Section 10.5.4 "Arc Start Condition File" on page 10-48.)

#### 10.5.3.2 Syntax

#### 10.5.3.3 Explanation

#### WELDn [1]

Choose one of the following tags.

These tags are enabled only when multiple applications are in use and two or more applications are set as arc welding application.

When there is only one application, these tags are not displayed.

Тад	Explanation	Note
WELDn	Selects the Power Source 1 to 8.	

### 10 Arc Welding Application

10.5 Basic Functions

#### AC = Current output value [2]/ASF# (Arc welding start condition file number) [3]

This tag can be added or omitted.

Tag	Explanation	Note
AC = Current output value	Specifies the output value of welding current.	Current value: 1 to 999 A The current output value can be specified by B/I/D/ B[]/I[]/D[]/LB/LI/LD/LB[]/ LI[]/LD[] variable.
ASF# (Arc welding start condition file number)	Specifies the arc welding start condition file number. Conditions to start welding are registered in the arc welding start condition file.	No. 1 to 1000 The number can be specified by B/I/D/LB/LI/ LD variable.

## AV = Voltage output value /AVP [4]= Percentage against the proper voltage output value [5]

Be sure to choose either of the following.

Tag	Explanation	Note
AV = Voltage output value	Specifies the output value of welding voltage. The output value of welding voltage is specified when the power supply is independent.	Voltage value: 0.1 to 50.0 V The voltage output value can be specified by B/I/D/ B[]/I[]/D[]/LB/LI/LD/LB[]/ LI[]/LD[] variable. (Unit: 0.1 V)
AVP = Percentage against the proper voltage output value	Specifies the percentage against the proper output value of welding voltage. The percentage against the proper voltage output value is specified when the power supply is synergic.	Percentage: 50 to 150% The voltage output value can be specified by B/I/D/ B[]/I[]/D[]/LB/LI/LD/LB[]/ LI[]/LD[] variable.

#### ■ V = Welding speed [6]

This tag can be added or omitted.

Tag	Explanation	Note
V = Welding speed	Specifies the welding speed.	Speed: 0.1 to 1500.0 mm/sec. The unit displayed can be changed by the setting of the parameter (S2C101). The speed can be specified by B/B[]/LB/LB[ ]/I/I[]/LI/LI[]/D/D[]/LD/LD[ ] variable. (Unit: 0.1 mm/sec.)

# Spot and Arc Welding Using Motor Gun

10 Arc Welding Application10.5 Basic Functions

### AN3 = Voltage target value [7]

This tag can be added or omitted.

Tag	Explanation	Note
AN3 = Voltage target value	Specifies the voltage target value for the analog output 3.	Target value: -14.00 to +14.00 V The voltage target value can be specified by I/LI/I[]/ LI[] variable. (Unit: 0.01 V)

### AN4 = Voltage target value [8]

This tag can be added or omitted.

Tag	Explanation	Note
AN4 = Voltage target value	Specifies the voltage target value for the analog output 4.	Target value: -14.00 to +14.00 V The voltage target value can be specified by I/LI/I[]/ LI[] variable. (Unit: 0.01 V)

10.5.3.4 Registering the ARCSET Instruction

#### With Additional Items to Specify Conditions

#### 10.5.4 Arc Start Condition File

#### 10.5.4.1 Displayed File Numbers

Two types of file numbers are displayed: The sequential serial number of all welding files and the file number allocated for each power source. Either number can be entered.

When specifying the condition file number for the ARCON or the ARCSET command of a job, set the number shown in the sequential serial number field.

#### 10.5.4.2 Tabs

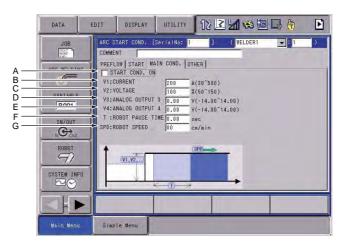

Conditions of the arc start condition file are divided into the tabs: "PREFLOW", "START", "MAIN COND.", and "OTHER"

To switch tabs, use the cursor key (left and right).

## Spot and Arc Welding Using Motor Gun

10 Arc Welding Application10.5 Basic Functions

#### "Main Condition" Tab Window

#### A. START COND. ON

Check this box to enable the start condition.

#### B. CURRENT (30 to 500 A)

- Welding current output value.
- C. VOLTAGE (12.0 to 45.0 V, 50 to 150%) Welding voltage output value.

#### D. ANALOG OUTPUT 3 (-14.00 to 14.00)

Displayed when the enhanced welding condition file function is enabled. This is the reference value to the Power Source through the analog output 3.

To use this, YEW board or XEW02 board, etc. with analog output ports must be added.

#### E. ANALOG OUTPUT 4 (-14.00 to 14.00)

Displayed when the enhanced welding condition file function is enabled. This is the reference value to the Power Source through the analog output 4.

To use this, YEW board or XEW02 board, etc. with analog output ports must be added.

#### F. ROBOT PAUSE TIME (0 to 10.00 seconds)

The length of time when the manipulator pauses at the beginning of welding.

If the start condition is enabled, the robot pause time is specified in the "START" tab and is not displayed in the "MAIN COND." tab.

#### G. ROBOT SPEED (1 to 600 cm/min)

Set the travel speed of the torch tip during welding. However, if the move instruction specifies a particular speed in the welding section, this particular speed is given priority.

#### "START" Tab Window

Check the box of "SLOPE ON" to specify whether the conditions set in "START" tab should be changed stepwisely or gradually to the conditions set in "MAIN COND." tab when starting welding.

The setting window switches as shown in the following.

- 10 Arc Welding Application
- 10.5 Basic Functions

Fig. 10-4: With "SLOPE ON" Checked

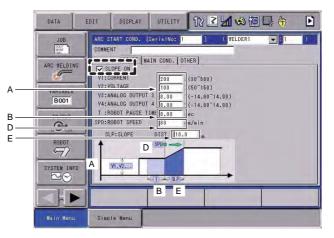

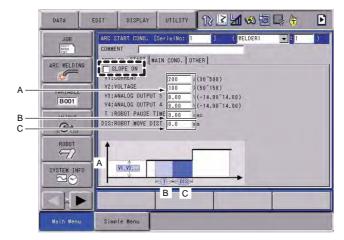

Fig. 10-5: With "SLOPE ON" Unchecked

#### A. The values of CURRENT, VOLTAGE, ANALOG OUTPUT 3, and ANALOG OUTPUT 4 of the start condition at the beginning of welding

Check the box of "START COND. ON" in the "MAIN COND." tab to set the values.

To use the analog output 3 and 4, YEW board or XEW02 board, etc. with analog output ports must be added.

#### B. ROBOT PAUSE TIME (0 to 10.00 seconds)

The length of time when the manipulator pauses at the beginning of welding.

#### C. ROBOT MOVE DIST (DISTANCE)

Displayed only when the slope function is OFF.

The distance which the manipulator moves along the welding line with the conditions set in "START" tab.

The manipulator moves at the speed specified in the "MAIN COND."

#### D. ROBOT SPEED (1 to 600 cm/min)

Displayed only when the slope function is ON.

Specifies the initial velocity when the manipulator starts moving after the robot pause time (specified in B. above).

Then, the speed gradually increases to the speed specified in the "MAIN COND." .

10 Arc Welding Application10.5 Basic Functions

### E. SLOPE DIST : Distance Specification

Displayed only when the slope function is ON.

The interval where the conditions are gradually changed from the ones set in the "START" tab to the ones set in the "MAIN COND." tab can be specified by millimeter.

#### "PREFLOW" Tab Window

Specifies the process before the beginning of welding.

DATA	DISPLAY UTILITY 1 🗹 🖬 🖏 🔯 🕞 🦣 🗈
JOB ARC TELDING VARIABLE BOOT IN/OUT IN/OUT ROBOT STATE	ARC START GOND. (Serising: 1 ) (VELDERI : 1 ) COMMENT PREFLOW START MAIN COND. OTHER A GAS: PREFLOW TIME 0.0 sec
SYSTEM INFO	
Main Menu	Simple Menu

#### A. GAS: PREFLOW TIME

When the manipulator moves to the welding start point, feeding of the shielding gas can be started before the manipulator reaches the welding start point.

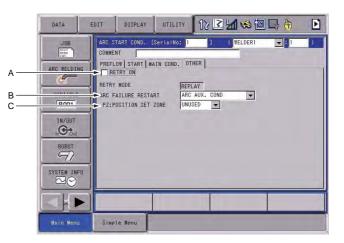

When to start feeding the shielding gas before the manipulator reaches the welding start point can be specified by seconds.

If the manipulator's traveling time from the preceding step to the welding start point step becomes shorter than the gas preflow time due to the job teaching, the shielding gas is fed when the manipulator starts traveling to the welding start point, thus the preflow time becomes shorter than the time specified.

- 10 Arc Welding Application
- 10.5 Basic Functions

### "OTHER" Tab Window

#### A. RETRY ON

Specifies whether the retry function is ON or OFF. Check this box to turn the retry function ON.

#### **B. ARC FAILURE RESTART**

Regarding the ON/OFF status of the restart function, select whether to turn OFF the restart function or to follow the settings in the Arc Auxiliary Condition File.

### C. PZ: POSITION SET ZONE

Specifies the distance from the actual position of the manipulator (the position fed back from the encoder of each axis of the manipulator) to the welding start point, where the manipulator is regarded to have reached the welding start point.

When the position set zone is set to "UNUSED", the welding start signal is output to the Power Source immediately after the move instruction to the welding start point is output.

When the position set zone is set to 1, the welding start signal is output to the Power Source after the manipulator completely reaches the welding start point and stops.

When a bigger number is selected (2, 3, or 4), the timing of the output of the welding start signal becomes earlier, i.e., the time from the output of the welding start signal to the welding start point becomes longer.

# Spot and Arc Welding Using Motor Gun

10 Arc Welding Application10.5 Basic Functions

#### 10.5.4.3 Comment

Comment can be added to every ARC START COND. file number. It is input or displayed with the arc start cond. window.

	DATA	EDIT DISPLAY UTILITY 🕅 🔀 🖾 🧐 🕞 🤭 💽
A	JOB ARC WELDING VARIABLE BOOT IN/OUT IN/OUT ROBOT SYSTEM INFO	DOMMENT         Image: Stand Control of St

- The window returns to the arc start cond. window and the input comment is displayed.

#### 10.5.5 Arc End Condition File

#### 10.5.5.1 Displayed File Numbers

Two types of file numbers are displayed: The serial number of all welding files (Serial No) and the file number allocated for each welder. Either number can be entered.

When specifying the condition file number for the ARCOF instruction of a job, set the number shown in the "Serial No" field.

#### 10.5.5.2 Tabs

Conditions of the arc end condition file are divided into the tabs: "CRATER COND. 1", "CRATER COND. 2", and "OTHER".

To switch tabs, use the cursor key (left and right).

10 Arc Welding Application10.5 Basic Functions

#### "CRATER COND. 1" Tab Window

Check the box of "SLOPE ON" to specify whether the welding conditions should be gradually changed to the crater condition before the manipulator reaches to the welding end point, or should be changed to the crater condition immediately after the manipulator reaches the welding end point.

The setting window switches as shown in the following.

Fig. 10-6: With "SLOPE ON" Checked

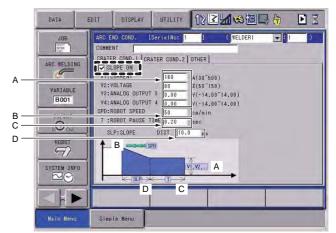

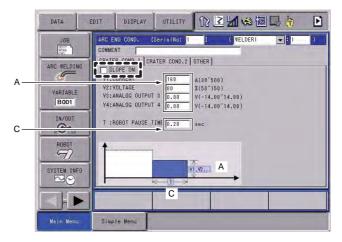

Fig. 10-7: With "SLOPE ON" Unchecked

#### A. The values of CURRENT, VOLTAGE, ANALOG OUTPUT 3, and ANALOG OUTPUT 4 of the crater condition 1 at the beginning of welding

The analog output 3 and 4 are displayed when the enhanced welding condition file function is enabled.

To use the analog output 3 and 4, YEW board or XEW02 board, etc. with analog output ports must be added.

#### B. ROBOT SPEED (1 to 600 cm/min)

Displayed only when the slope function is ON.

This is the manipulator's travel speed at the welding end point.

The manipulator's travel speed changes from the speed specified with the move instruction of a job or the speed specified by the welding start condition file to the speed specified above.

- 10 Arc Welding Application
- 10.5 Basic Functions

#### C. ROBOT PAUSE TIME (0 to 10.00 seconds)

The length of time when the manipulator continues welding while the manipulator is stopped at the welding end point.

D. SLOPE DIST : Distance Specification
 Displayed only when the slope function is ON.
 The interval where the conditions are gradually changed from the ones set in the "MAIN COND." tab to the ones set in the "CRATER COND. 1"

#### "CRATER COND. 2" Tab Window

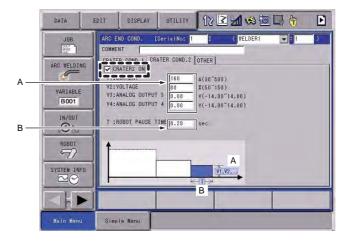

tab can be specified by millimeter.

Check the box of "CRATER2 ON" to set the condition to either of the following:

- Check "CRATER2 ON" to change the crater condition stepwisely after the manipulator reaches the welding end point
- Uncheck "CRATER2 ON" to continue welding with the crater condition 1

The setting window switches as shown in the following.

#### Fig. 10-8: With "CRATER2 ON" Checked

#### Fig. 10-9: With "CRATER2 ON" Unchecked

Fig. 10-12: Timing of Each Process Time of Arc End Process

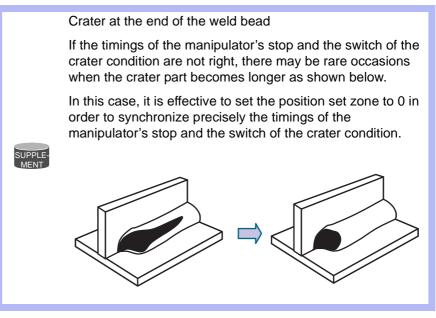

Manipulator Operating Time Welding Condition Output Time Wire Anti-Stick Process Time Wire-Stick Check Time Gas Afterflow Time

# A. PZ: POSITION SET ZONE

Specifies the distance from the actual position of the manipulator (the position fed back from the encoder of each axis of the manipulator) to the welding end point, where the manipulator is regarded to have reached the welding end point.

When the position set zone is set to 1, the condition switches to the crater condition after the manipulator completely reaches the welding end point and stops.

When the position set zone is set to 1, the cycle time extends by 0.1 to 0.2 seconds, because the judgment that the manipulator has reached the welding end point is delayed, compared with when the position set zone is set to other than 0.

Set the appropriate position set zone depending on the shape of crater.

#### 163543-1CD

# Spot and Arc Welding Using Motor Gun

### 10 Arc Welding Application

10.5 Basic Functions

# **B. MTS: MONITORING TIME**

Wire stick monitoring time at the end of welding.

# C. AST: ANTI-STICK ON

Check this box so that the process of automatic wire-stick release will be performed if wire-stick is detected at the end of welding.

When the anti-stick function is ON, the cycle time becomes longer than when it is OFF.

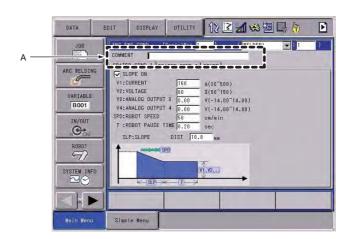

- When the anti-stick is ON: After the wire stick monitoring of the step B above, the manipulator starts to move.
- When the anti-stick is OFF: Simultaneously with the start of the wire stick monitoring of the step B above, the manipulator starts to move.

## D. GAS: AFTERFLOW TIME

Specifies with the length of time to feed the shielding gas while the manipulator is moving from the end of welding to the next step.

### 10.5.5.3 Comment

Comment can be added to every ARC END COND. file number. It is input or displayed with the arc start cond. window.

### A. COMMENT

The comment added to each file number is displayed in this box. Up to 32 characters can be input for the comment.

<sup>163543-1CD</sup> Spot and Arc Welding Using Motor Gun	10 Arc Welding Application 10.5 Basic Functions				
10.5.	Welding Speed Specifications				
	The welding speed is determined by one of the following:				
	<ul> <li>Welding speed specified by the play speed of the move instruction</li> </ul>				
	<ul> <li>Welding speed specified by the ARCON instruction or the arc start condition file</li> </ul>				
	When the move instruction does not specify a speed				
	Welding is performed at the welding speed of the ARCON instruction.				
	When the move instruction and ARCON instruction specify different speeds				
	Priority is given to one according to the parameter values described below. To switch the priorities, change the parameter setting.				
Parameter	Contents Initial Value				

# 10.5.7 Welding Execution Function During Teach Mode

Move instruction speed is priority

ARCON instruction speed is priority : 1

When the [INTERLOCK] + [WELD ON/OFF] keys are pressed simultaneously, the LED is lit with a beep sound, turning ON the system output signal "#50065: PERMISSIBLE WORK IN TEST RUN".

0

: 0

When pressing these keys once again, the LED goes out and the beep sound stops, then the system output signal "#50065: PERMISSIBLE WORK IN TEST RUN" turns OFF.

The standard ladder program of arc welding application supports the function that welding can be performed during the teach mode by the signal "#50065: PERMISSIBLE WORK IN TEST RUN".

\*Welding can be performed during a test run only when the security mode is the management mode.

\*Welding cannot be performed during a test run even while the LED is lit unless the security mode is the management mode.

AxP005

x: Application number

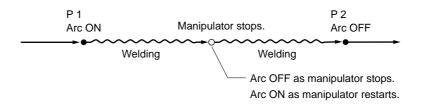

During a test run of the teach mode, the manipulator may not move at the actual welding speed due to the speed limit in some cases. (e.g. at a welding position/point where the manipulator significantly changes its posture during a coordinated motion with a station)

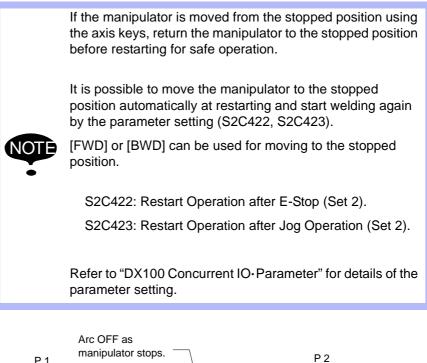

In these cases, weld bead may be thicker compared with the bead that is formed during the playback operation, or burn through may occur as the speed of the welding is different from the speed that is appropriate for the welding conditions (current and voltage). 10 Arc Welding Application10.5 Basic Functions

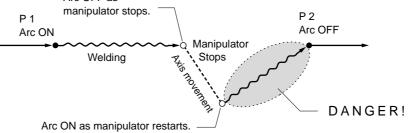

# 10.5.8 Notes on Arc Welding

### 10.5.8.1 Notes on Restarting

If the manipulator stops during welding, the arc is automatically turned OFF. When restarted, the arc is automatically turned ON, and the manipulator starts welding towards the step where the cursor is located on the screen. The welding current and voltage when arc is turned ON again are the same as those before stopping.

Spot and Arc Welding Using Motor Gun

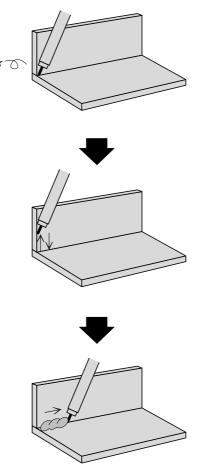

10 Arc Welding Application10.6 Arc Retry Function

# 10.6 Arc Retry Function

An attachment to the welding start position of a non-conductive material, such as rust, soot, and oil, may cause an arc start failure during arc start. An arc start failure stops the manipulator and interrupts work. This is prevented by using the arc retry function.

When an arc start failure occurs and this arc retry function is performed, the ARCON process is repeated according to the retry condition defined in the Arc Auxiliary Condition File. The manipulator repeats the ARCON procedure as it slightly shifts its position near the arc starting point. After that, the manipulator returns to the starting point when an arc starts and continues working.

- 1. Arc Start Failure
- 2. The Retry Procedure
  - Returns toward the previous step and performs a retract inching, then returns to the teaching starting point and repeats the ARCON procedure.
- 3. After a successful arc start, the manipulator continues to weld.

10 Arc Welding Application10.6 Arc Retry Function

A B C D E F

ARC AUXIL COND NO	IARY COND	ay Utility 🕼 🗈 🎬 🧐 🕼
<retry fu<br="">NO. RETRACT REPLAY DI SPEED CURRENT VOLTAGE</retry>		: 1 times : 1.50 sec : 10.0 mm : 30 cm/min : 100 A : 100 %

### A. NO. (0 to 9 times)

Maximum repetition count for the arc retry process.

### B. RETRACT TIME (0 to 2.50 seconds)

Wire retracting time in the arc retry process.

### C. REPLAY DISTANCE (0 to 99.9 mm)

Manipulator moving distance for an arc retry process at the replay mode.

### D. SPEED (1 to 600 cm/min)

Speed of the manipulator when it returns to the welding start point at arc retry.

### E. CURRENT (1 to 999A)

Welding current output when the manipulator returns to the welding start point at arc retry.

### F. VOLTAGE (0 to 50.0V, 50 to 150%)

Welding voltage output when the manipulator returns to the welding start point at arc retry.

When the twin synchronous function, etc. is used, the arc retry function cannot be used.

# Spot and Arc Welding Using Motor Gun

10 Arc Welding Application10.7 Arc Restart Function

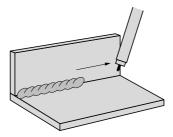

# 10.7 Arc Restart Function

When the manipulator stops because of an arc failure, a simple start would leave a break in the welding line. This is prevented by using the arc restart function.

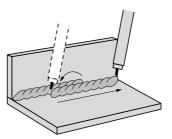

When the arc restart function is executed, the manipulator is restarted using the method specified in the Arc Auxiliary Condition File<sup>\*1</sup>.

There are three methods to restart the manipulator after an arc failure:

 With the arc OFF the controller outputs an error signal and the message "RESTARTING FOR ARC", but continues manipulator's movement. After exiting the arc section, the controller outputs the message "END OF ARC RESTARTING", and continues the operation.

• With the arc ON trial, the manipulator automatically returns for the specified overlap length <sup>\*2</sup>, and then continues welding.

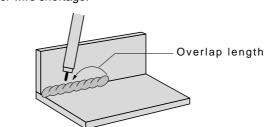

• The manipulator stops and waits for a manual intervention. After intervention (A), the operator should return the manipulator to the original stop position (B). And then press [START] again. The manipulator returns for the specified overlap length <sup>2</sup> (C) and continues the work.

Spot and Arc Welding Using Motor Gun

- Arc Welding Application
   Arc Restart Function
- \*1 The arc auxiliary condition file defines the following: current, voltage and speed at restart; method of restart after a gas shortage or wire shortage.

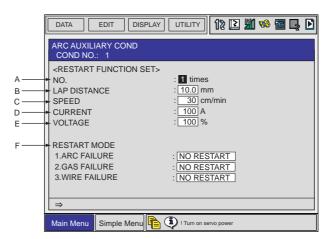

\*2 The overlap length (the length of the section where welding is repeated after a restart) can be set as desired (0 to 99.9mm).

A cursor operation resets the "restarting" status. Therefore, the arc restart function cannot be executed after the cursor operation.

# 10.7.1 Arc Auxiliary Condition File

10.7.1.1 Arc Restart Function Setting

### A. NO. (0 to 9 times)

Maximum repetition count for the arc restart process regarding the same welding section.

B. LAP DISTANCE (0 to 99.9mm)

Overlapped welding distance in a restart process.

C. SPEED (1 to 600 cm/min)

Speed of the manipulator as it moves backward in an arc restart process.

### D. CURRENT (1 to 999A)

Welding current output when the manipulator moves backward in an arc restart process.

Arc Welding Application
 Automatic Wire-stick Release Function

When the complete synchronization of the twin synchronous function is used, the arc restart function cannot be used.

# 10.8 Automatic Wire-stick Release Function

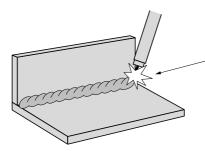

### Automatic Wire-stick Release Function

The automatic wire-stick release function can be used if wire stick is detected in spite of the anti-stick process.

When this function is used, the manipulator does not immediately output the wire sticking signal upon detecting a wire stick, but automatically attempts to release the sticking by applying a certain voltage.

Only when the stick release process has failed for a specified number of times, the manipulator stops and outputs the wire stick signal.

This function is specified in the arc end condition file or the ARCOF instruction's additional items. When it is used, the voltage and number of attempts are set in the arc auxiliary condition file.

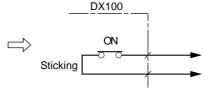

Automatic Wire-stick Release Even if a single attempt has failed, the process is repeated up to the specified maximum repetition count.

### Manipulator Stopped by Wire Stick

If a wire stick occurs at the end of welding, the manipulator immediately stops in the hold status. While the manipulator remains in the hold status, the [HOLD] lamp lights and the external system output signal "Wire Sticking" is output.

Wire stick occurs

External output signal is turned ON.

Spot and Arc Welding Using Motor Gun

- **D. CLOCK (0 to 2.00 seconds)** Sticking release process duration.

# **10.9 Wire-stick Check Function**

### Anti-Stick Function

The wire may stick to the workpiece after welding is completed (1).

As an anti-stick process, the Power Source temporarily increases the voltage at the end of welding (2).

After the anti-stick process, a wire stick check is performed (3).

If the anti-stick process failed and a wire stick is detected, the manipulator enters a hold status or performs the automatic sticking release process, depending on the anti-stick condition specified.

Time required for the anti-stick process differs depending on the Power Sources.

The anti-stick process times for different Power Sources is registered in the Power Source characteristic file.

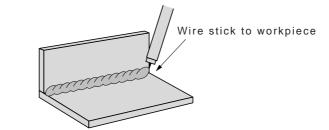

The wire check is performed after the anti-stick process time has elapsed.

### Wire stick

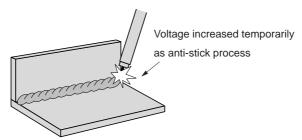

"Wire stick" refers to the contact of the wire to the workpiece as observed after the arc-OFF.

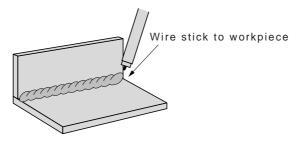

- 10 Arc Welding Application 10.10 Slope Up/Down Function
- 1. Welding End (Wire Stick Occurrence)

2. Anti-stick Process

- 3. Wire Stick Check
  - Wire stick check is performed after elapsing of the anti-stick process time defined in the Power Source characteristic file.

# 10.10 Slope Up/Down Function

The slope up/down function is used during welding to gradually change the welding condition.

This function is extremely effective in conducting heat for such operations on workpieces such as the one shown below.

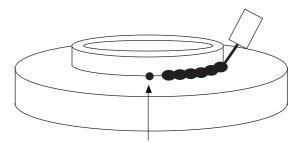

During the welding of a workpiece as shown below, especially during the period before the end of welding, the tearing or dropping of metal can occur quite frequently due to heat conduction.

However, even in this example, if the welding condition is gradually decreased before the end of welding, tearing and dropping of metal can be prevented.

### 10.10.1 ARCCTS

### 10.10.1.1 Function

The ARCCTS instruction is used with a move instruction to gradually change the welding current and voltage during welding.

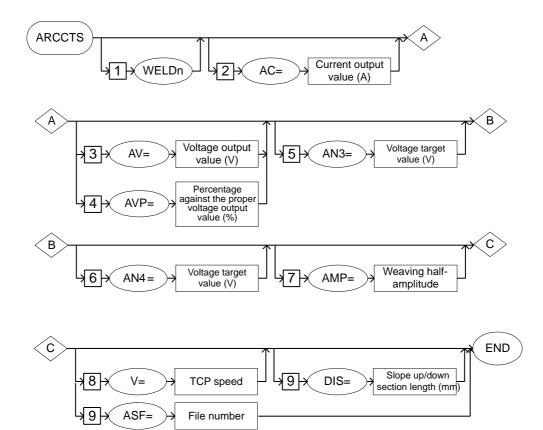

A gradual change in the current or voltage is specified by an aimed value and the length of the slope up/down section. The length of the slope up/ down section is set from the move start point (DIS).

If no length is specified, the entire section of the move instruction is used.

AVP = Percentage against the proper voltage output value	Specifies the target value of welding voltage by the percentage against the proper output value of welding voltage.	Percentage: 50 to 150% The voltage output value can be specified by B/I/D/ B[]/I[]/D[]/LB/LI/LD/LB[]/ LI[]/LD[] variable.

# ■ AN3 = Voltage target value [5]

This tag can be added or omitted.

Tag	Explanation	Note
AN3 = Voltage target value	Specifies the voltage target value for the analog output 3.	Target value: -14.00 to +14.00 V The voltage target value can be specified by I/LI/I[]/ LI[] variable. (Unit: 0.01 V)

# ■ AN4 = Voltage target value [6]

This tag can be added or omitted.

Tag	Explanation	Note
AN4 = Voltage target value	Specifies the voltage target value for the analog output 4.	Target value: -14.00 to +14.00 V The voltage target value can be specified by I/LI/I[]/ LI[] variable. (Unit: 0.01 V)

# Spot and Arc Welding Using Motor Gun

10	Arc Welding Application
10.10	3 Slope Up/Down Function

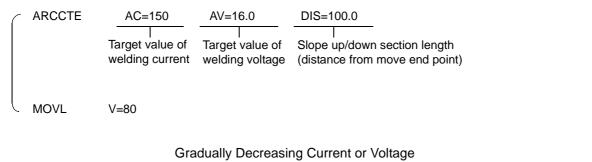

# DIS = Slope up/down section length [7]

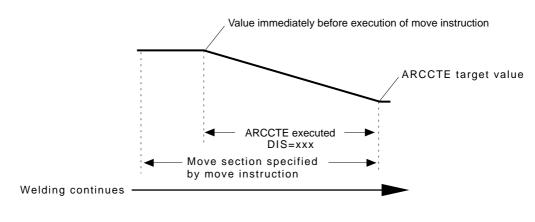

This tag can be added or omitted.

Тад	Explanation	Note
DIS = Slope up/down section length	Specifies the slope up/down section length where the current and voltage are gradually changed. The length is set as the distance from the move start point. If no length is specified, the entire section of the move instruction is used.	Length: 0.1 to 6553.5 mm The slope up/down section length can be specified by B/I/D/B[]/I[]/D[]/LB/LI/LD/ LB[]/LI[]/LD[] variable. (Unit: 0.1 mm)
AEF# (Arc welding end condition file number)	Specifies the arc welding end condition file number. Conditions to end welding are registered in the arc welding end condition file.	No. 1 to 1000 The number can be specified by B/I/D/LB/LI/ LD variable.

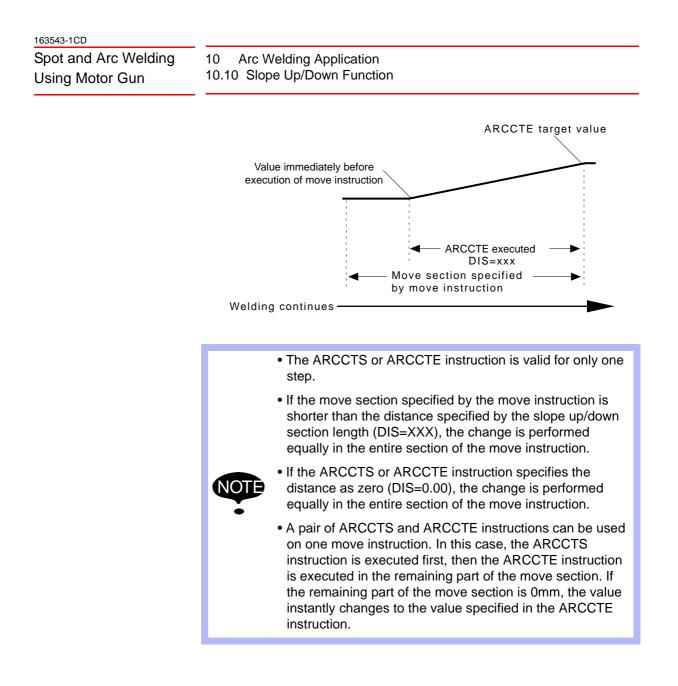

# <Example>

The current and voltage are gradually changed as the manipulator moves toward the move end point specified by the move instruction. The aimed current and voltage values are 150A and 16.0V respectively. The slope up/down section length is 100mm from the move end point.

# **10.12 Weaving Condition File**

## 10.12.1 Weaving Basic Coordinate System

Weaving is performed based on the following coordinate system. This coordinate system is automatically generated when weaving is executed.

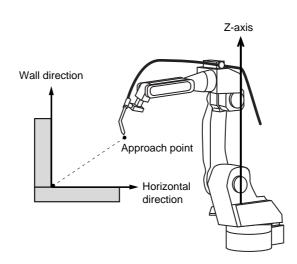

Weaving Basic Coordinate System

Wall Direction:	Z-direction of the robot axis
Horizontal Direction:	The direction to the approach point from the wall
Direction of Travel:	The direction in which the manipulator moves from the weaving start point to the end point

The approach point is a point indicated by a step immediately before the step where weaving starts.

Depending on the mounting status and shape of the workpiece, a definition of the above coordinate system may not be sufficient to generate a weaving pattern. In this case, register the reference point REFP 1 or REFP 2.

For details, refer to Section 10.12.4.2 "Editing the Condition Data" on page 10-104.

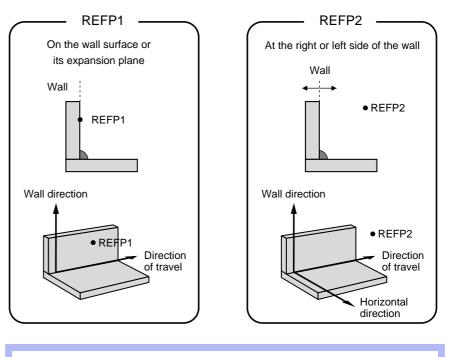

163543-1CD	
Spot and Arc Welding	10 Arc Welding Application 10.12 Weaving Condition File
Using Motor Gun	

10.12.1.1 Cases that Require the Registration of Reference Points

SUPPLE-MENT

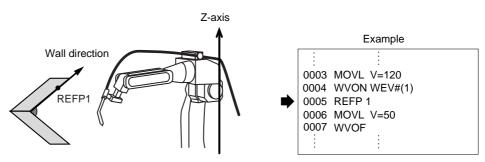

The registration of the reference point REFP1 or REFP2 is not usually required. They are required only with a special workpiece condition, etc.

The REFP1, that defines the wall direction, is a point on the wall surface or its expansion plane. The REFP2, which defines the horizontal direction, is a point at the right or left side of the wall.

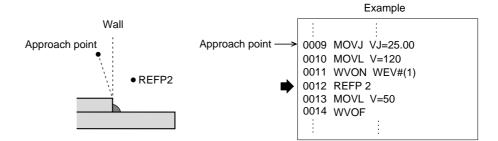

For information on registering REFP, refer to Section 3.2.3.2 "Registering Reference Point Instructions" on page 3-16.

< **Example 1** > REFP1 is registered because the wall direction is not parallel to the Z-axis of the robot coordinates.

< **Example 2** > REFP2 is registered because the approach point is at another side of the wall.

Spot and Arc Welding Using Motor Gun

# 10 Arc Welding Application10.12 Weaving Condition File

10.12.2 WVON

10.12.2.1 Function

This is the weaving start operation.

# Spot and Arc Welding Using Motor Gun

### 10 Arc Welding Application 10.12 Weaving Condition File

10.12.2.3 Explanation

### RBn [1]

Be sure to choose one of the following tags.

Tag	Explanation	Note
RBn	Specifies the weaving motion of robot 1 to 8.	

### WEV# (Weaving condition file number)/AMP [2] = Weaving halfamplitude [3]

Be sure to choose one of the following tags.

Тад	Explanation	Note
WEV# (Weaving condition file number)	Specifies the weaving condition file number. Conditions for the weaving motion are registered in the weaving condition file.	No. 1 to 16 The number can be specified by B/I/D/LB/LI/ LD variable.
AMP = Weaving half- amplitude	Specifies the half-amplitude of weaving.	Half-amplitude: 0.1 to 99.9 mm The half-amplitude can be specified by B/B[]/LB/LB[ ]/I/I[]/LI/LI[]/D/D[]/LD/LD[ ] variable. (Unit: 0.1 mm)

## ■ FREQ = Weaving frequency [4]

Only when "AMP = Weaving half-amplitude" is selected in the above "WEV# (Weaving condition file number)/AMP [2] = Weaving halfamplitude [3]" on page 10-91, be sure to add the following tag.

Tag	Explanation	Note
FREQ = Weaving frequency	Specifies the weaving frequency.	Frequency: 1.0 to 5.0 Hz The frequency can be specified by B/I/D/B[]/I[]/ D[]/LB/LI/LD/LB[]/LI[]/LD[ ] variable. (Unit: 0.1 Hz)

### ■ ANGL = Weaving angle [5]

Only when "AMP = Weaving half-amplitude" is selected in the above "WEV# (Weaving condition file number)/AMP [2] = Weaving halfamplitude [3]" on page 10-91, this tag is added or omitted after "FREQ = Weaving frequency [4]" on page 10-91

Тад	Explanation	Note
ANGL = Weaving angle	Specifies the weaving angle.	Angle: 0.1 to 180.0 degree The degree can be specified by B/I/D/B[]/I[]/ D[]/LB/LI/LD/LB[]/LI[]/LD[ ] variable. (Unit: 0.1)

# Spot and Arc Welding Using Motor Gun

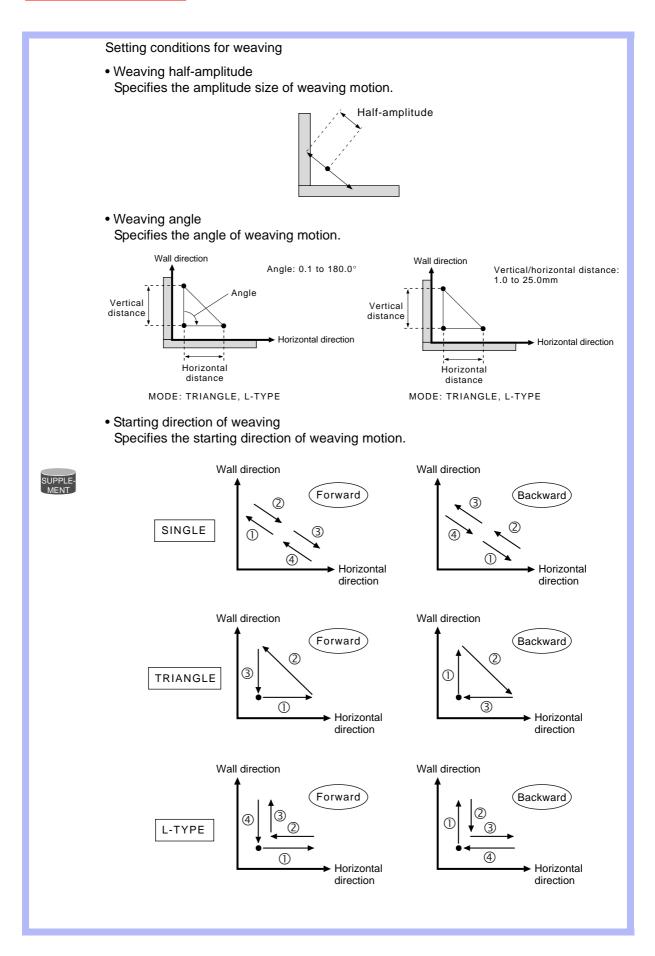

### 10 Arc Welding Application 10.12 Weaving Condition File

# DIR = Starting direction of weaving [6]

This tag can be added or omitted.

Tag	Explanation	Note
DIR = Starting direction of weaving	Specifies the starting direction of weaving.	Direction: 0 to 1 0: Forward 1: Backward The direction can be specified by B/I/D/B[]/I[]/ D[]/LB/LI/LD/LB[]/LI[]/LD[] variable.

10 Arc Welding Application 10.12 Weaving Condition File

## 10.12.4 WEAVING CONDITION Window

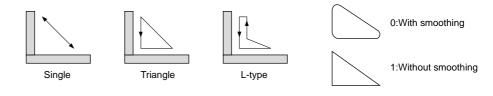

#### A. COND NO. (1 to 255)

Displays a weaving condition file number between 1 and 255.

#### B. MODE, C. SMOOTH

There are three weaving modes: single, triangle, and L-type. Each mode can be specified with or without smoothing.

Weaving Modes

## D. SPEED TYPE (FREQUENCY, MOTION TIME)

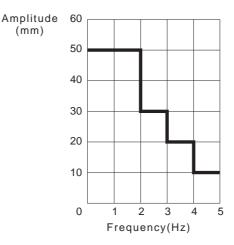

Specifies the setting type of the weaving motion speed. Two types are available: setting by frequency and setting by the weaving time in each weaving section.

Smoothing

10 Arc Welding Application 10.12 Weaving Condition File

## E. FREQUENCY

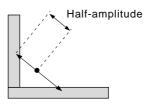

Specifies the weaving frequency if "SPEED TYPE" is set to "FREQUENCY". Note that the maximum frequency is determined by the amplitude as illustrated in the graph below. Specify a frequency within the allowable range.

Maximum Frequencies for Different Amplitudes

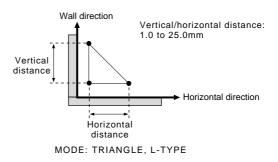

#### F. PATTERN

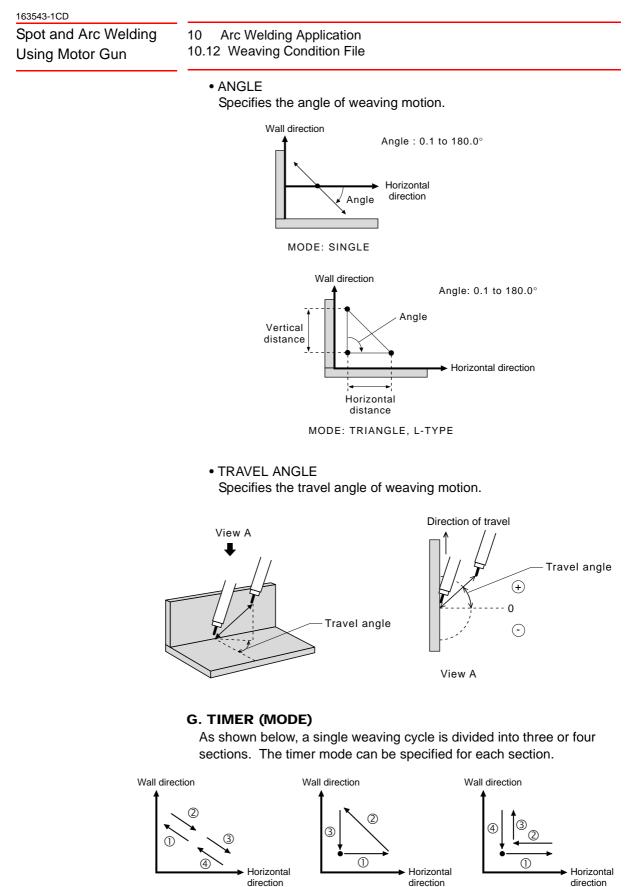

- AMPLITUDE
- Specifies the amplitude size at weaving when "MODE" is set to "SINGLE".

• VERTICAL, HORIZONTAL

If "MODE" is set to "TRIANGLE" or "L-TYPE", the data for the triangle must be set to define the weaving pattern.

Single

Set one of the following timer modes:

WEAV STOP : Weaving stops but manipulator moves.

Triangle

L-type

10 Arc Welding Application 10.12 Weaving Condition File

ROBOT STOP : Manipulator stops.

WEAV STOP: Weaving stops but manipulator moves.

ROBOT STOP: Manipulator pauses.

#### **H. MOTION TIME**

If "SPEED TYPE" is set to "MOTION TIME", the weaving time specified here determines the moving speed in each of the weaving sections (explained in "TIMER (MODE)" above).

I. STOP TIMER

Specifies the timer to determine weaving stop or manipulator stop for each section (explained in "TIMER (MODE)" above).

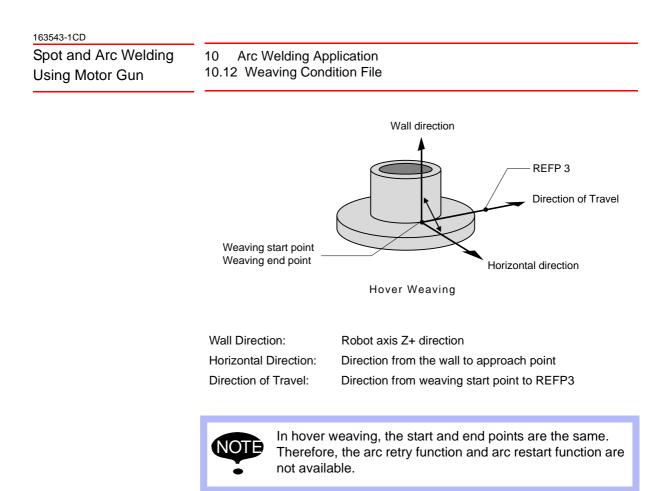

#### J. HOVER WEAVING COND. (option)

- SET (ON/OFF)
- Specifies whether hover weaving is used or not.
- TIMER
- Finishes hover weaving when the time specified here ends.
- INPUT SIGNAL
   Finishes hover weaving when the input signal specified here is input.

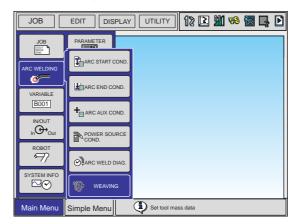

Reference Job	
NOP	
MOVJ VJ=10.00	
MOVJ VJ=25.00	
REFP 3	
ARCON ASF#(1)	Welding start point.
WVON WEV#(1)	Reference point for defining the direction of travel.
MOVL V=60	
	*Teaching by interpolation instruction, not by joint interpolation.
WVOF	The same point with the welding start point.
ARCOF	
MOVJ VJ=25.00	
MOVJ VJ=25.00	
END	

In hover weaving, the start and end points are the same. Therefore, the weaving direction cannot be determined. For this reason, the user needs to register a reference point (REFP 3) to define the direction of travel.

- 10.12.4.1 Displaying a Weaving File
  - 1. Select {ARC WELDING} under the main menu.

- 10 Arc Welding Application10.12 Weaving Condition File

10.12.5.3 Method to Prohibit Weaving by Means of a System Input Signal

The system input signal 40047 is used.

The system input signal can prohibit weaving at any time during a play operation, regardless of whether or not it is a check operation.

## 10.13 Changing Welding Conditions During Playback

#### 10.13.1 ARC COND ADJUSTMENT Window

While the ARC COND ADJUSTMENT window is displayed in the play mode, the welding current and voltage can be changed using the function keys.

The arc welding performance during playback changes with the welding current and voltage. The adjusted data of the current and voltage values can be reflected in the associated instructions or welding condition files.

DATA	edit 🛛 🛛 display 🛛 utility 🗍 🕼 🗈 🎢 🅫 🖾 📑 🗜

CURR(A) VOLT(%)	: 200 INST : ARCON : 100 INST : ARCON
DATA	: No change data
Main Menu	imple Menu I urm on servo power

## A. CURR (A)/VOLT (%)

The welding current value and welding voltage value are displayed.

## B. DATA (Change data or No change data)

Specifies whether or not to rewrite the data of condition file or additional item.

10 Arc Welding Application

10.13 Changing Welding Conditions During Playback

The data are rewritten when the execution of the instruction which includes the changed condition data ends.

#### C. INST

- The last instruction that sets the welding current or voltage is displayed. The instruction includes the following:
  - ARCON
  - ARCSET

Changing the welding conditions during playback is enabled only when the command condition is analog type.

## 10.13.1.1 Displaying the ARC COND ADJUSTMENT Window

- 1. Press [AREA] on the PLAYBACK window.
- 2. Select {UTILITY}.
- 3. Select {WELD COND. ADJUST.}.

## Changing the Welding Conditions

- 1. Line up the cursor with the current or voltage condition to be adjusted.
  - The current and voltage can be independently changed.

Even if control jumps from one job to another job, rewriting of the arc condition for the former job is performed.

10 Arc Welding Application

10.13 Changing Welding Conditions During Playback

#### 10.13.2 Notes on Modification of Welding Conditions

10.13.2.1 When Condition Data cannot be Modified

In the following cases, the window returns to the previous window of the ARC COND ADJUSTMENT window. Even if the function keys are pressed, current and voltage cannot be modified.

- When the mode is switched (to the teach mode, etc).
- When the emergency stop is activated.

The maximum current and voltage values are determined according to the voltage and current characteristics of the Power Source.

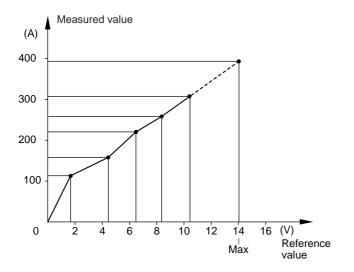

NOTE

When using a Power Source with the current characteristics as shown in the following table:

When the data points are interpolated on the graph, it can be observed that the maximum reference value (14.00V) is reached when the welding current specified by the ARCON instruction is 395 A. This becomes the maximum value.

Fig. 10-14: Welding Current Output Characteristics

Reference Value	Measured Value
(V)	(A)
1.80	110
4.40	165
6.40	220
8.30	265
10.50	315
0	0
0	0
0	0

10.13.2.2 ARCON Instruction

The ARCON instruction without an additional item is not subject to arc condition rewriting.

- ARCON ASF#(1) : Current and voltage values can be rewritten.
- ARCON AC=220 AVP=100: Current and voltage values can be rewritten.
- ARCON : Conditions cannot be rewritten.

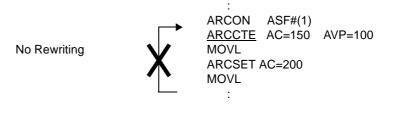

<sup>163543-1CD</sup> Spot and Arc Welding Using Motor Gun	10 Arc Welding Application 10.14 Displaying Welding Alarm History
10.13.2.3 ARCOF Instruct	ion

The conditions of the ARCOF instruction cannot be rewritten.

#### 10.13.2.4 ARCCTS and ARCCTE Instructions

The arc condition adjustment operation is invalid while the slope up/down instruction ARCCTS or ARCCTE is executed.

Even if "Change data" is set on the ARC COND ADJUSTMENT window, rewriting cannot be done after the ARCCTS or ARCCTE instruction.

Refer to Section 10.8.1 "Arc Auxiliary Condition File" on page 10-69 for details regarding the ARCCTS and ARCCTE instructions.

## 10.14 Displaying Welding Alarm History

The historical records of welding-related alarms can be viewed on the user alarm (system section) window.

To view the detailed information about alarm occurrence, use the alarm detailed window.

#### 10.14.1 Alarm History Windows

There are 5 types of alarm history windows :

- MAJOR ALARM
- MINOR ALARM
- USER ALARM (SYSTEM)
- USER ALARM (USER)
- OFF-LINE ALARM

In each window, the alarm code, occurrence date, time, and detailed information are displayed.

10 Arc Welding Application

10 Arc Welding Application10.15 Arc Welding Management and Maintenance

## 10.15 Arc Welding Management and Maintenance

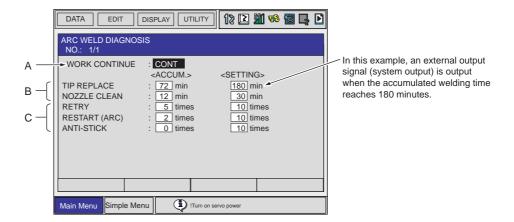

#### 10.15.1 ARC WELD DIAGNOSIS Window

An optimum arc welding requires timely contact-tip replacement and nozzle cleaning.

It is also recommended that the user check how often such functions as arc retry, arc restart, and automatic anti-stick have been used and adjust the operating environment and work conditions accordingly.

The usage of the above-mentioned functions can be controlled or confirmed on the ARC WELD DIAGNOSIS window.

For example, contact-tip replacement is initially set at 180 minutes. When the welding time reaches 180 minutes, an external output signal (system output) is output. The operator can then replace the tip or adjust as necessary.

#### A. WORK CONTINUE(CONT, STOP)

When the manipulator is restarted after it stops in the middle of a work section, the manipulator either performs welding over the remaining part of the section or moves without performing welding.

#### B. TIP REPLACE, NOZZLE CLEAN (0 to 999 minutes)

In the "SETTING" fields, specify the optimum timings for contact-tip replacement and nozzle cleaning. The initial values are 180 minutes for contact-tip replacement; 30 minutes for nozzle cleaning. The "ACCUM". fields display an accumulated service duration.

#### C. RETRY, RESTART (ARC), ANTI-STICK

In each of the "SETTING" fields, specify a reference value for the number of times each function is used. As an initial setting, 10 is specified for each function. Each of the "ACCUM". fields displays the accumulated count, showing how many times the function has been used.

#### ARC RETRY, ARC RESTART, and ANTI-STICK counts:

These counts are different from the maximum repetition counts specified in the arc auxiliary condition file. These counts show how many times these functions have actually been used.

## 10.16 Arc Monitor Function

The arc monitor function is used to monitor, analyze and control the welding conditions (welding current and welding voltage) of the specified welding section.

- Samples the welding conditions and show them on the display.
- Calculates the average and deviation and detects an error.
- Saves the results of measurement and analysis in the file.

	Additional Item	WELD1, WELD2, WELD3, WELD4 WELD5, WELD6, WELD7, WELD8	Displayed only when using multiple manipulators.			
		AC = <welding current=""> ASF#(<arc condition="" file="" number="" start="">)</arc></welding>	AC: 1 to 999A ASF#(): 1 to 1000 AV: independent 0.1 to 50.0V AVP: synergic 50 to 150%			
		AV = <welding voltage=""> AVP = <percentage against="" proper="" welding<br="">voltage&gt;</percentage></welding>				
		T = <manipulator stopping="" time=""></manipulator>	0.01 to 655.35 sec			
		V = <manipulator moving="" speed=""></manipulator>	0.1 to 1500.0 mm/sec 1 to 9000 cm/min			
		RETRY	Specifies use of arc retry function.			
	Example	ARCON AC=200 AVP=100 T=0.30 RETRY ARCON AC=200 AV=22.0 T=0.30 ARCON ASF#(1) ARCON				
ARCOF	Function	Outputs arc end conditions and an arc end instruction for the Power Source.				
	Additional Item	WELD1, WELD2, WELD3, WELD4 WELD5, WELD6, WELD7, WELD8	Displayed only when using multiple manipulators.			
		AC = <welding current=""> AEF#(<arc condition="" end="" file="" number="">)</arc></welding>	AC: 1 to 999A AEF#(): 1 to 396			
		AV = <welding voltage=""> AVP = <percentage against="" proper="" welding<br="">voltage &gt;</percentage></welding>	AV: independent 0.1 to 50.0V AVP: synergic 50 to 150%			
		T = <manipulator stopping="" time=""></manipulator>	0.01 to 655.35 sec			
		ANTSTK	Specifies use of wire anti-stick function.			
	Example	ARCOF AC=180 AVP=80 T=0.30 ANTSTK ARCOF AC=180 AV20.0 T=0.30 ARCOF AEF#(1) ARCOF				

10 Arc Welding Application 10.17 Appendix 1

Table 10-6: Arc Welding Instructions (Sheet 2 of 3)

ARCSET	Function	Changes the welding conditions individually.			
	Additional Item	WELD1, WELD2, WELD3, WELD4 WELD5, WELD6, WELD7, WELD8	Displayed only when using multiple manipulators.		
		AC = <welding current=""> ASF#(<arc condition="" file="" number="" start="">)</arc></welding>	1 to 999A ASF#(): 1 to 1000		
		AV = <welding voltage=""> AVP = <percentage against="" proper="" welding<br="">voltage &gt;</percentage></welding>	AV: independent 0.1 to 50.0V AVP: synergic 50 to 150%		
		V = <manipulator moving="" speed=""></manipulator>	0.1 to 1500.0 mm/sec 1 to 9000 cm/min		
		AN3 = <analog 3="" output=""></analog>	-14.00 to 14.00V		
		AN4 = <analog 4="" output=""></analog>	-14.00 to 14.00V		
	Example	ARCSET AC=200 ARCSET AV=20.0 ARCSET AVP=95 ARCSET V=80 ARCSET AN3=10.00			
ARCCTS	Function	Changes the welding conditions gradually during	ng execution of welding.		
	Additional Item	WELD1, WELD2, WELD3, WELD4 WELD5, WELD6, WELD7, WELD8	Displayed only when using multiple manipulators.		
		AC = <welding current=""></welding>	1 to 999A		
		AV = <welding voltage=""> AVP = <percentage against="" proper="" welding<br="">voltage &gt;</percentage></welding>	AV: independent 0.1 to 50.0V AVP: synergic 50 to 150%		
		AN 3 = <analog 3="" output=""></analog>	-14.00 to 14.00V		
		AN4 = <analog 4="" output=""></analog>	-14.00 to 14.00V		
		DIS = <distance from="" movement's="" position="" start="" the=""></distance>	0.00 to 6553.5 mm		
	Example	ARCCTS AC=200 AVP=100 DIS=100.0 ARCCTS AC=200 AV=22.0 AN3=10.0 DIS=5.0	-		
ARCCTE	Function	Changes the welding conditions gradually during execution of welding.			
	Additional Item	WELD1, WELD2, WELD3, WELD4 WELD5, WELD6, WELD7, WELD8	Displayed only when using multiple manipulators.		
		AC = <welding current=""></welding>	1 to 999A		
		AV = <welding voltage=""> AVP = <percentage against="" proper="" welding<br="">voltage &gt;</percentage></welding>	AV: independent 0.1 to 50.0V AVP: synergic 50 to 150%		
		AN 3 = <analog 3="" output=""></analog>	-14.00 to 14.00V		
		AN4 = <analog 4="" output=""></analog>	-14.00 to 14.00V		
		DIS = <distance end="" from="" movement's="" position="" the=""></distance>	0.00 to 6553.5 mm		
	Example	ARCCTE AC=200 AVP=100 DIS=100.0 ARCCTE AC=200 AV=22.0 AN3=10.0 DIS=5.0			
AWELD	Function	Specifies welding current by current reference	value.		
	Additional Item	WELD1, WELD2, WELD3, WELD4 WELD5, WELD6, WELD7, WELD8	Displayed only when using multiple manipulators.		
		<current reference="" value=""></current>	-14.00 to 14.00V		
	Example	AWELD 12			

163543-1CD

Spot and Arc Welding
Using Motor Gun

10 Arc Welding Application 10.18 Appendix 2

VWELD	Function	Specifies welding voltage by voltage value.	
	Additional Item	WELD1, WELD2, WELD3, WELD4 WELD5, WELD6, WELD7, WELD8	Displayed only when using multiple manipulators.
		<voltage value=""></voltage>	-14.00 to 14.00V
	Example	VWELD 2.5	
WVON	Function	Starts weaving.	
	Additional Item	RB1, RB2, RB3, RB4	Displayed only when using multiple manipulators.
		WEV#( <weaving condition="" file="" number="">)</weaving>	1 to 255
	Example	WVON WEV#(1)	
WVOF	Function	Ends weaving.	
	Additional Item	RB1, RB2, RB3, RB4	Displayed only when using multiple manipulators.
		None	
	Example	WVOF	•

Table 10-6: Arc Welding Instructions (Sheet 3 of 3)

## 10.18 Appendix 2

#### 10.18.1 Power Source Condition File Initial Value

The initial value data for 24 Power Sources are prepared as follows:

Table 10-7: Welder Condition Data File

Power Source No.	Power Source Name	Power Supply	Shielding Gas	Wire Diameter (mm)
1	MOTOWELD-E series 350A class	Synergic	MAG (or CO2)	1.2 (or any)
2	MOTOWELD-E series 350A class	Independent	MAG (or CO2)	1.2 (or any)
3	MOTOWELD-E series 500A class	Synergic	MAG (or CO2)	1.2 (or any)
4	MOTOWELD-E series 500A class	Independent	MAG (or CO2)	1.2 (or any)
5	MOTOWELD-S350-AJ2/3 (without STC)	Synergic	CO2	1.2
6	MOTOWELD-S350-AJ2/3 (without STC)	Synergic	MAG	1.2
7	MOTOWELD-S350-AJ2/3 (without STC)	Independent	CO2	1.2
8	MOTOWELD-S350-AJ2/3 (without STC)	Independent	MAG	1.2
9	MOTOWELD-S350-AJ2/3 (without STC)	Synergic	CO2	0.9 (or 1.0)
10	MOTOWELD-S350-AJ2/3 (without STC)	Synergic	MAG	0.9 (or 1.0)
11	MOTOWELD-S350-AJ2/3 (without STC)	Independent	CO2	0.9 (or 1.0)
12	MOTOWELD-S350-AJ2/3 (without STC)	Independent	MAG	0.9 (or 1.0)
13	MOTOWELD-S350-AJ2/3 (with STC)	Synergic	CO2	1.2
14	MOTOWELD-S350-AJ2/3 (with STC)	Synergic	MAG	1.2

10 Arc Welding Application10.18 Appendix 2

### Table 10-7: Welder Condition Data File

Power Source No.	Power Source Name	Power Supply	Shielding Gas	Wire Diameter (mm)
15	MOTOWELD-S350-AJ2/3 (with STC)	Independent	CO2	1.2
16	MOTOWELD-S350-AJ2/3 (with STC)	Independent	MAG	1.2
17	MOTOWELD-S350-AJ2/3 (with STC)	Synergic	CO2	0.9 (or 1.0)
18	MOTOWELD-S350-AJ2/3 (with STC)	Synergic	MAG	0.9 (or 1.0)
19	MOTOWELD-S350-AJ2/3 (with STC)	Independent	CO2	0.9 (or 1.0)
20	MOTOWELD-S350-AJ2/3 (with STC)	Independent	MAG	0.9 (or 1.0)
21	SHINKO ES 350	Synergic	CO2	1.2
22	DAIHEN CPV 350	Synergic	CO2	1.2
23	MOTOWELD-S500 (without STC)	Synergic	CO2	1.2
24	MOTOWELD-S500 (without STC)	Synergic	MAG	1.2

#### 10.18.2 Contents of 24 Welder Condition Files

The following tables give the original contents of the provided Power Source condition files, that are associated with the Power Source numbers 1 through 24:

11 Table of Basic Instructions

## 11 Table of Basic Instructions

- <> indicates numerical or alphabetical data.
- If multiple items are shown in one section, select one of the items.

- 11 Table of Basic Instructions
- 11.1 Move Instructions

MOVJ	Function	Moves to a taught point with joint interpolation t	ype.
	Additional Item	Position data, Base axis position data, Station axis position data	These data do not appear on the screen.
		VJ= <play speed=""></play>	VJ: 0.01 to 100.00%
		PL= <position level=""></position>	PL:0 to 8
		NWAIT	
		UNTIL statement	
		ACC=(acceleration adjustment ratio)	ACC: 20 to 100%
		DEC=(deceleration adjustment ratio)	DEC: 20 to 100%
	Example	MOVJ VJ=50.00 PL=2 NWAIT UNTIL IN#(16)=	ON
MOVL	Function	Moves to a taught point with linear interpolation	type.
	Additional Item	Position data, Base axis position data, Station axis position data	These data do not appear on the screen.
		V= <play speed="">, VR=<play of="" posture="" speed="" the="">, VE=<play axis="" external="" of="" speed=""></play></play></play>	V:0.1 to 1500.0 mm/s 1 to 9000.0 cm/min VR:0.1 to 180.0 deg/s VE:0.01 to 100.00%
		PL= <position level=""></position>	PL:0 to 8
		CR=(corner radius)	CR: 1.0 to 6553.5mm
		NWAIT	
		UNTIL statement	
		ACC=(acceleration adjustment ratio)	ACC: 20 to 100%
		DEC=(deceleration adjustment ratio)	DEC: 20 to 100%
	Example	MOVL V=138 PL=0 NWAIT UNTIL IN#(16)=ON	
MOVC	Function	Moves to a taught point with circular interpolation	on type.
	Additional Item	Position data, Base axis position data, Station axis position data	These data do not appear on the screen.
		V= <play speed="">, VR=<play of="" posture="" speed="" the="">, VE=<play axis="" external="" of="" speed=""></play></play></play>	Same as MOVL.
		PL= <position level=""></position>	PL:0 to 8
		NWAIT	
		ACC=(acceleration adjustment ratio)	ACC: 20 to 100%
		DEC=(deceleration adjustment ratio)	DEC: 20 to 100%
	Example	MOVC V=138 PL=0 NWAIT	I

## **11.1 Move Instructions**

## Spot and Arc Welding Using Motor Gun

11 Table of Basic Instructions

11.1 Move Instructions

MOVS	Function	Moves to a taught point with spline interpolation t	ype.
	Additional Item	Position data, Base axis position data, Station axis position data	These data do no appear on the screen.
		V= <play speed="">, VR=<play of="" posture="" speed="" the="">, VE=<play axis="" external="" of="" speed=""></play></play></play>	Same as MOVL.
		PL= <position level=""></position>	PL:0 to 8
		NWAIT	
		ACC=(acceleration adjustment ratio)	ACC: 20 to 100%
		DEC=(deceleration adjustment ratio)	DEC: 20 to 100%
	Example	MOVS V=120 PL=0	
IMOV	Function	Moves the specified increment from the current p interpolation type.	osition with linear
	Additional Item	P <variable number="">, BP<variable number="">, EX<variable number=""></variable></variable></variable>	
		V= <play speed="">, VR=<play of="" posture="" speed="" the="">, VE=<play axis="" external="" of="" speed=""></play></play></play>	Same as MOVL.
		PL= <position level=""></position>	PL:0 to 8
		NWAIT	
		BF,RF,TF,UF# ( <user coordinate="" number="">)</user>	BF: base coordinates RF: robot coordinates TF: tool coordinates UF: user coordinates
		UNTIL statement	
		ACC=(acceleration adjustment ratio)	ACC: 20 to 100%
		DEC=(deceleration adjustment ratio)	DEC: 20 to 100%
	Example	IMOV P000 V=138 PL=1 RF	
REFP	Function	Defines a reference point (e.g. wall point for wear	ving).
	Additional Item	<reference number="" point=""></reference>	wall point 1 for weaving :1 wall point 2 for weaving :2
		Position data, Base axis position data, Station axis position data	These data do not appear on the screen.
	Example	REFP 1	
SPEED	Function	Sets play speed.	
	Additional Item	VJ= <joint speed="">, V=<tcp speed="">, VR=<play of="" posture="" speed="" the="">, VE=<play axis="" external="" of="" speed=""></play></play></tcp></joint>	VJ:Same as MOVJ. V,VR,VE: Same as MOVL.
	Example	SPEED VJ=50.00	

- 11 Table of Basic Instructions
- 11.1 Move Instructions

When start IMOV instruction again after IMOV instruction was aborted due to execute the following operations, the manipulator moves the added values, which is set anew from the aborted position, in the linear interpolation. The values become greater than the set added value. Please do not execute the IMOV instruction when changing move distance by the abort causes a problem.

- External servo OFF signal 2 (#40066)
- Turning OFF the servo power due to alarm occurring
- Enable signal
- Mode switch
- Enable switch

## Spot and Arc Welding Using Motor Gun

11 Table of Basic Instructions

11.2 I/O Instructions

### 11.2 I/O Instructions

DOUT	Function	Turns the external output signals ON and OFF.		
	Additional Item	OT# ( <output number="">), OGH# (<output group="" number="">), OG# (<output group="" number="">) Number of addressed output signals: OT#(xx)=1;OGH#(xx)=4(per group); OG#(xx)=8(per group) OGH#(xx) is not subject to parity check; only the binary specification is allowed. FINE</output></output></output>	With a high	
			degree of accuracy	
	Example	DOUT OT#(12) ON	-	
PULSE	Function	Outputs a pulse signal as an external output signal.		
Additional Item		OT# ( <output number="">), OGH# (<output group="" number="">), OG# (<output group="" number="">)</output></output></output>		
		T= <time (seconds)=""></time>	0.01 to 655.35 s 0.30 s unless otherwise specified	
	Example	PULSE OT# (10) T=0.60		
DIN	Function	Sets input signals in variables.		
	Additional Item	B <variable number="">         IN# (<input number=""/>),         IGH# (<input group="" number=""/>),         IGF (<output group="" number="">),         OT# (<output group="" number="">),         OGH# (<output group="" number="">),         OG# (<output group="" number="">),         SIN# (<system input="" number="">),         SOUT# (<system number="" output="">),         SOUT# (<system number="" output="">)         Number of addressed input signals:         IN#(xx)=1;IGH#(xx)=4(per group);         IG#(xx)=8(per group)         Number of addressed output signals:         OT#(xx)=1;OGH#(xx)=4(per group);         OG#(xx)=8(per group)         IGH#(xx) and OGH#(xx) are not subject to parity</system></system></system></output></output></output></output></variable>		
	Example	check; only the binary specification is allowed. DIN B016 IN#(16)		
	-	DIN B002 IG#(2)		

11 Table of Basic Instructions

11.2 I/O Instructions

WAIT	Function	Waits until the external input signal status matches the	e specified status.	
Additiona Item		IN# ( <input number=""/> ), IGH# ( <input group="" number=""/> ), IG# ( <input group="" number=""/> ), OT# ( <user number="" output="">), OGH# (<output group="" number="">), SIN# (<system input="" number="">), SOUT# (<system number="" output="">)</system></system></output></user>		
		<status>,B<variable number=""></variable></status>		
		T= <time (seconds)=""></time>	0.01 to 655.35 s	
	Example	WAIT IN# (12)=ON T=10.00 WAIT IN# (12)=B002		
AOUT	Function	Outputs the specified voltage to the general-purpose analog output port		
	Additional	AO# ( <output number="" port="">)</output>	1 to 40	
	Item	<output voltage(v)=""></output>	-14.0 to 14.0	
	Example	AOUT AO# (2) 12.7		
ARATION	Function	Starts the analog output corresponding to the speed.		
	Additional	AO#( <output number="" port="">)</output>	1 to 40	
	ltem	BV = <basic voltage=""></basic>	-14.00 to 14.00	
		V = <basic speed=""></basic>	0.1 to 150.0 mm/s 1 to 9000 cm/min	
		OFV = <offset voltage=""></offset>	-14.00 to 14.00	
	Example	ARATION AO#(1) BV=10.00 V=200.0 OFV=2.00		
ARATIOF	Function	Ends the analog output corresponding to the speed.		
	Additional Item	AO#( <output number="" port="">)</output>	1 to 40	
	Example	ARATIOF AO#(1)		

## Spot and Arc Welding Using Motor Gun

- Table of Basic Instructions 11
- 11.3 Control Instructions

	11.3 Co	ntrol Instructions
JUMP	Function	Jumps to the specified label or
	Additional Item	* <label character="" string="">, JOB:<job name="">, IG# (<input group="" number=""/>), B<variable number="">, I<variable number="">, D<variable number=""></variable></variable></variable></job></label>

JUMP	Function	Jumps to the specified label or job.	
	Additional Item	* <label character="" string="">, JOB:<job name="">, IG# (<input group="" number=""/>), B<variable number="">, I<variable number="">, D<variable number=""> UF# (user coordinates number)</variable></variable></variable></job></label>	
		IF statement	
	Example	JUMP JOB:TEST1 IF IN#(14)=OFF	
*	Function	Indicates a jump destination.	
(label)	Additional Item	<jump destination=""></jump>	8 characters or less
	Example	*123	
CALL	Function	Calls the specified job.	
	Additional Item	JOB: <job name="">, IG# (<input group="" number=""/>), B<variable number="">, I<variable number="">, D<variable number=""></variable></variable></variable></job>	
		UF# (user coordinates number)	
		IF statement	
	Example	CALL JOB:TEST1 IF IN# (24)=ON CALL IG#(2) (The job is called by the patterns of input signal. In t cannot be called.)	his example, Job 0
RET	Function	Returns to the call source job.	
	Additional Item	IF statement	
	Example	RET IF IN#(12)=OFF	
END	Function	Declares the end of a job.	
	Additional Item		
	Example	END	
NOP	Function	No operation.	
	Additional Item		
	Example	NOP	
TIMER	Function	Stops for the specified time.	
	Additional Item	T= <time (seconds)=""></time>	0.01 to 655.35 s
	Example	TIMER T=12.50	
IF statement	Function         Evaluates the specified condition and makes a judgment           Described after an instruction that specifies a certain action         Format: <ltem1>=,&lt;&gt;,&lt;=,&gt;=,&lt;,&gt;<ltem2></ltem2></ltem1>		
	Additional	<item1></item1>	
	ltem	<item2></item2>	
	Example	JUMP *12 IF IN#(12)=OFF	

11

Table of Basic Instructions 11.3 Control Instructions

UNTIL	Function	Monitors the specified input signal during an action and stops the action		
statement		when the specified signal status is observed. Described after an instruction that specifies a certain action.		
	Additional	IN# ( <input number=""/> )		
	Item	<status></status>		
	Example	MOVL V=300 UNTIL IN#(10)=ON		
PAUSE	Function	Instructs a pause.		
	Additional Item	IF statement		
	Example	PAUSE IF IN#(12)=OFF		
3	Function	Dispalys a comment.		
(comment)	Additional Item	<comment></comment>	32 characters or less	
	Example	'Draws 100mm size square.		
CWAIT	Function	Waits for execution of the instruction on the next line. Used with the NWAIT tag which is an additional item of a move instruction.		
	Additional Item			
	Example	MOVL V=100 NWAIT DOUT OT#(1) ON CWAIT DOUT OT#(1) OFF MOVL V=100		
ADVINIT	Function	Initializes the prereading instruction processing. Used to adjust the access timing for variable data.		
	Additional Item			
	Example	ADVINIT		
ADVSTOP	Function	Stops the prereading instruction processing. Used to adjust the access timing for variable data.		
	Additional Item			
	Example	ADVINIT		

### Spot and Arc Welding Using Motor Gun

11 Table of Basic Instructions

11.4 Shift Instructions

## 11.4 Shift Instructions

SFTON	Function	Starts a shift	operation.	
Additional Item		BP <variable EX<variable BF,RF,TF,</variable </variable 	P <variable number="">, BP<variable number="">, EX<variable number="">, BF,RF,TF, UF#(<user coordinate="" number="">)</user></variable></variable></variable>	
	Example	SFTON P00	1 UF#(1)	
SFTOF	SFTOF Function		operation.	
	Additional Item			
	Example	SFTOF		
-	Function	Obtains the shift value in the specified coordinate system from Data 2 and 3, and stores the obtained element values in Data 1. Format:MSHIFT <data1><coordinate><data2><data3></data3></data2></coordinate></data1>		
	Additional	Data1	PX <variable number=""></variable>	
	Item	Coordinate	BF,RF,TF, UF# ( <user coordinate="" number="">), MTF</user>	BF: base coordinates RF: robot coordi- nates TF: tool coordinates UF: user coordinates MTF: tool coordinates for the master
		Data2	PX <variable number=""></variable>	
		Data3	PX <variable number=""></variable>	
	Example	MSHIFT PX	000 RF PX001 PX002	

- 11 Table of Basic Instructions
- 11.5 Operating Instructions

ADD	Function	Adds Data1 and Data2, and stores the result in Data1. Format:ADD <data1><data2></data2></data1>				
	Additional Item	Data1	B <variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, P<variable number="">, BP<variable number="">, EX<variable number=""></variable></variable></variable></variable></variable></variable></variable>	Data1 must always be a variable.		
		Data2	Constant, B <variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, P<variable number="">, BP<variable number="">, EX<variable number=""></variable></variable></variable></variable></variable></variable></variable>			
	Example	ADD 1012	1013			
SUB	Function	Subtracts Data2 from Data1, and stores the result in Data1. Format:SUB <data1><data2></data2></data1>				
	Additional Item	Data1	B <variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, P<variable number="">, BP<variable number="">, EX<variable number=""></variable></variable></variable></variable></variable></variable></variable>	Data1 must always be a variable.		
		Data2	Constant, B <variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, P<variable number="">, BP<variable number="">, EX<variable number=""></variable></variable></variable></variable></variable></variable></variable>			
		SUB 1012 1013				

## 11.5 Operating Instructions

63543-1CD						
Spot and Arc	• • • •		Basic Instructions g Instructions			
Jsing Motor	Gun II.		ginardelona			
MUL	Function	Multiplies Data1 by Data2, and stores the result in Data1. Format:MUL <data1><data2></data2></data1>				
		Pxxx(0):all Pxxx(2):Y-a Pxxx(4):Tx	Data1 can be an element in a position variable. Pxxx(0):all axis data, Pxxx(1):X-axis data, Pxxx(2):Y-axis data, Pxxx(3):Z-axis data, Pxxx(4):Tx-axis data, Pxxx(5):Ty-axis data, Pxxx(6):Tz-axis data			
	Additional Item	Data1	B <variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, P<variable number=""> (<element number&gt;), BP<variable number=""> (<element number&gt;), EX<variable number=""> (<element number&gt;)</element </variable></element </variable></element </variable></variable></variable></variable></variable>	Data1 must always be a variable.		
		Data2	Constant, B <variable number="">, I<variable number="">, D<variable number="">, R<variable number=""></variable></variable></variable></variable>			
	Example	MUL I012 I013 MUL P000 (3) 2 (Multiply the Z-axis data by 2.) Divides Data1 by Data2, and stores the result in Data1.				
		Format:DIV <data1><data2> Data1 can be an element in a position variable. Pxxx(0):all axis data, Pxxx(1):X-axis data, Pxxx(2):Y-axis data, Pxxx(3):Z-axis data, Pxxx(4):Tx-axis data, Pxxx(5):Ty-axis data, Pxxx(6):Tz-axis data</data2></data1>				
	Additional Item	Data1	B <variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, P<variable number=""> (<element number&gt;), BP<variable number=""> (<element number&gt;), EX<variable number=""> (<element number&gt;)</element </variable></element </variable></element </variable></variable></variable></variable></variable>	Data1 must always be a variable.		
		Data2	Constant, B <variable number="">, I<variable number="">, D<variable number="">, R<variable number=""></variable></variable></variable></variable>			
	Example	DIV I012 I013 DIV P000 (3) 2 (Divide the Z-axis data by 2.)				
INC	Function	Increments the value of the specified variable by 1.				
	Additional Item	B <variable number="">,I<variable number="">, D<variable number=""></variable></variable></variable>				
	Example	INC 1043				
DEC	Function Additional		s the value of the specified variable by 1. number>,I <variable number="">,</variable>			
	Item	D <variable< td=""><td></td><td></td></variable<>				
	Example	DEC 1043				

11 Table of Basic Instructions

11.5 Operating Instructions

AND	Function		AND of Data1 and Data2, and stores the re <data1><data2></data2></data1>	sult in Data1.			
	Additional	Data1	B <variable number=""></variable>				
	Item	Data2	B <variable number="">, Constant</variable>				
	Example	AND B012 E	AND B012 B020				
OR	Function		Obtains the OR of Data1 and Data2, and stores the result in Data1. Format:OR <data1><data2></data2></data1>				
	Additional	Data1	B <variable number=""></variable>				
	Item	Data2	B <variable number="">, Constant</variable>				
	Example	OR B012 B0	020				
NOT	Function		Obtains the NOT of Data2, and stores the result in Data1. Format:NOT <data1><data2></data2></data1>				
	Additional	Data1	B <variable number=""></variable>				
	Item	Data2	B <variable number="">, Constant</variable>				
	Example	NOT B012 B	3020				
XOR	Function	Data1.	Obtains the exclusive OR of Data1 and Data2, and stores the result in Data1. Format:XOR <data1><data2></data2></data1>				
	Additional	Data1	B <variable number=""></variable>				
	Item	Data2	B <variable number="">, Constant</variable>				
	Example	XOR B012 E	XOR B012 B020				
SET	Function	Sets Data2 to Data1. Format:SET <data1><data2></data2></data1>					
	Additional Item	Data1	B <variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, P<variable number="">, S<variable number="">, BP<variable number="">, EX<variable number=""></variable></variable></variable></variable></variable></variable></variable></variable>	Data1 must always be a variable.			
		Data2	Constant, B <variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, S<variable number="">, EXPRESS</variable></variable></variable></variable></variable>				
	Example	SET 1012 1020					
	Example	0					
SETE	Function		an element in a position variable.	1			
SETE			an element in a position variable. P <variable number=""> (<element number&gt;), BP<variable number=""> (<element number&gt;), EX<variable number=""> (<element number&gt;)</element </variable></element </variable></element </variable>				
SETE	Function Additional	Sets data to	P <variable number=""> (<element number&gt;), BP<variable number=""> (<element number&gt;), EX<variable number=""> (<element< td=""><td></td></element<></variable></element </variable></element </variable>				

Spot and Arc Welding Using Motor Gun

11 Table of Basic Instructions11.5 Operating Instructions

GETE	Function	Extracts an	element in a position variable.			
	Additional	D <variable< th=""><th>number&gt;</th><th></th></variable<>	number>			
	ltem	P <variable number=""> (<element number="">), BP<variable number=""> (<element number="">), EX<variable number=""> (<element number="">)</element></variable></element></variable></element></variable>				
	Example	GETE D006 P012 (4)				
GETS	Function	Sets a system variable to the specified variable.				
	Additional Item	B <variable I<variable n<br="">D<variable R<variable PX<variable< td=""><td>umber&gt;, number&gt;, number&gt;,</td><td></td></variable<></variable </variable </variable></variable 	umber>, number>, number>,			
		\$B <variable \$I<variable \$D<variable \$R<variable \$PX<variable Constant, B</variable </variable </variable </variable </variable 	System variable			
	Example	GETS B000 \$B000 GETS I001 \$I[1] GETS PX003 \$PX001				
CNVRT	Function	Converts the position variable (Data2) into a position variable of the specified coordinate system, and stores the converted variable in Data1. Format:CNVRT <data1><data2><coordinate></coordinate></data2></data1>				
	Additional Item	Data1	PX <variable number=""></variable>			
		Data2	PX <variable number=""></variable>			
		BF,RF,TF,UF# ( <user coordinate="" number="">),MTF</user>		BF: base coordinates RF: robot coordinates TF: tool coordinates UF: user coordinates MTF:tool coordinates for the master		
	Example	CNVRT PX	000 PX001 BF	L		

11 Table of Basic Instructions

11.5 Operating Instructions

CLEAR	Function	Starting with the variable number in Data1, clears (sets to zero) as many variables as specified by a number in Data2.			
			AR <data1><data2></data2></data1>		
	Additional Item	Data1	B <variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, \$B<variable number="">, \$I<variable number="">, \$D<variable number="">, \$R<variable number="">,</variable></variable></variable></variable></variable></variable></variable></variable>		
		Data2	<number of="" variables="">, ALL,STACK</number>	ALL:Clears variables of the variable number in Data1 and of all the variable numbers that follow. STACK:Clears all variables in the job call stack.	
	Example	CLEAR B00 CLEAR STA			
SIN	Function	Obtains the sine of Data2, and stores the result in Data1. Format:SIN <data1><data2></data2></data1>			
	Additional Item	Data1	R <variable number=""></variable>	Data1 must always be a real type variable.	
		Data2	<constant>, R<variable number=""></variable></constant>		
	Example	SIN R000 R	001 (Sets the sine of R001 to R000.)		
COS	Function	Obtains the cosine of Data2, and stores the result in Data1. Format:COS <data1><data2></data2></data1>			
	Additional Item	Data1	R <variable number=""></variable>	Data1 must always be a real type variable.	
		Data2	<constant>, R<variable number=""></variable></constant>		
	Example	COS R000 F	R001 (Sets the cosine of R001 to R000.)		
ATAN	Function	Obtains the arc tangent of Data2, and stores the result in Data1. Format:ATAN <data1><data2></data2></data1>			
	Additional Item	Data1	R <variable number=""></variable>	Data1 must always be a real type variable.	
		Data2	<constant>, R<variable number=""></variable></constant>		
	Example	ATAN R000	R001 (Sets the arc tangent of R001 to R0	00.)	
SQRT	Function	Obtains the square root of Data2, and stores the result in Data1. Format:SQRT <data1><data2></data2></data1>			
	Additional Item	Data1	R <variable number=""></variable>	Data1 must always be a real type variable.	
		Data2	<constant>, R<variable number=""></variable></constant>		
	Example	SQRT R000	R001 (Sets the square root of R001 to R0	000.)	

63543-1CD Spot and Arc	Weldina 11	Table of Ba	sic Instructions		
Jsing Motor (	• • • •	5 Operating I			
-					
MFRAME	Function	Creates a user coordinate using the position data for the given three as definition points. <data1> indicates the definition point ORG posi- data, <data2> the definition point XX position data, and <data3> the definition point XY position data. Format: MFRAME <user coordinate=""> <data1> <data2> <data3></data3></data2></data1></user></data3></data2></data1>			
	Additional	UF#( <user co<="" td=""><td>ordinate number&gt;)</td><td>1 to 24</td></user>	ordinate number>)	1 to 24	
	Item	Data1	PX <variable number=""></variable>		
		Data2	PX <variable number=""></variable>		
		Data3	PX <variable number=""></variable>		
	Example	MFRAME UF	#(1) PX000 PX001 PX002		
MULMAT	Function	Data1.	natrix product of Data2 and Data3, and sto MAT <data1> <data2> <data3></data3></data2></data1>	res the result in	
	Additional	Data1	P <variable number=""></variable>		
	Item	Data2	P <variable number=""></variable>		
		Data3	P <variable number=""></variable>		
	Example	MULMAT P000 P001 P002			
INVMAT	Function	Obtains the inverse matrix of Data2, and stores the result in Data1. Format: INVMAT <data1> <data2></data2></data1>			
	Additional	Data1	P <variable number=""></variable>		
	Item	Data2	P <variable number=""></variable>		
	Example	INVMAT P000 P001			
SETFILE	Function	Changes the contents data of a condition file into the numeric data of Data1 The contents data of a condition file to be changed is specified by the element number.			
	Additional Item	Contents data of a condition file	WEV#( <condition file<br="">number&gt;)(<element number="">)</element></condition>		
		Data1	Constant, D <variable number=""></variable>		
	Example	SETFILE WEV#(1)(1) D000			
GETFILE	Function	Stores the contents data of a condition file in Data1. The contents data of condition file to be obtained is specified by the element number.			
	Additional	Data1	D <variable number=""></variable>		
	Item	Contents data of a condition file	WEV#( <condition file<br="">number&gt;)(<element number="">)</element></condition>		
	Example	GETFILE D000 WEV#(1)(1)			
GETPOS	Function		sition data of Data2 (step number) in Data	1.	
	Additional	Data1	PX <variable number=""></variable>		
	Item	Data2	STEP# ( <step number="">)</step>		
	Example	GETPOS PX0		1	
VAL	Function	Converts the numeric value of the character string (ASCII) of Data2 into t real number, and stores the result in Data1. Format: VAL <data1> <data2></data2></data1>			
	Additional Item	Data1	B <variable number="">, I <variable number="">, D <variable number="">, R <variable number=""></variable></variable></variable></variable>		
		Data2	Character string, S <variable number=""></variable>		
	Example	VAL B000 "12	3"		

- 11
  - Table of Basic Instructions

11.5 Operating Instructions

ASC	Function	Obtains the character code of the first letter of the character string (ASCII) Data2, and stores the result in Data1. Format:ASC <data1><data2></data2></data1>			
	Additional Item	Data1	B <variable number="">, I <variable number="">, D <variable number=""></variable></variable></variable>		
		Data2	Character string, S <variable number=""></variable>		
	Example	ASC B000 '	'ABC"		
CHR\$	Function	the result in	Obtains the character (ASCII) with the character code of Data2, and stores the result in Data1. Format:CHR\$ <data1><data2></data2></data1>		
	Additional	Data1	S <variable number=""></variable>		
	Item	Data2	Constant, B <variable number=""></variable>		
	Example	CHR\$ S000	) 65		
MID\$	Function	character st	Obtains the character string (ASCII) of any length (Data 3, 4) from the character string (ASCII) of Data2, and stores the result in Data1. Format:MID\$ <data1><data2><data3><data4></data4></data3></data2></data1>		
	Additional	Data1	S <variable number=""></variable>		
	Item	Data2	Character string, S <variable number=""></variable>		
		Data3	Constant, B <variable number="">, I <variable number="">, D <variable number=""></variable></variable></variable>		
		Data4	Constant, B <variable number="">, I <variable number="">, D <variable number=""></variable></variable></variable>		
	Example	MID\$ S000 "123ABC456" 4 3			
LEN	Function	Obtains the total number of bytes of the character string (ASCII) of Data2, and stores the result in Data1. Format:LEN <data1><data2></data2></data1>			
	Additional Item	Data1	B <variable number="">, I <variable number="">, D <variable number=""></variable></variable></variable>		
		Data2	Character string, S <variable number=""></variable>		
	Example	LEN B000 "	LEN B000 "ABCDEF"		
CAT\$	Function	Combines the character string (ASCII) of Data2 and Data3, and stores the result in Data1. Format:CAT\$ <data1><data2><data3></data3></data2></data1>			
	Additional	Data1	S <variable number=""></variable>		
	Item	Data2	Character string, S <variable number=""></variable>		
		Data3	Character string, S <variable number=""></variable>		
	Example	CAT\$ S000	"ABC" "DEF"
